(54) Title: METABOTROPIC GLUTAMATE RECEPTOR ANTAGONISTS AND THEIR USE FOR TREATING CENTRAL
NERVOUS SYSTEM DISEASES

(57) Abstract: The present invention provides compounds, and pharmaceutical compositions containing those compounds, that are active at metabotropic glutamate receptors. The compounds are useful for treating neurological diseases and disorders. Methods of preparing the compounds also are disclosed.

METABOTROPIC GLUTAMATE RECEPTOR ANTAGONISTS AND THEIR USE FOR TREATING CENTRAL NERVOUS SYSTEM DISEASES

FIELD OF THE INVENTION

The present invention provides compounds that are active at metabotropic glutamate receptors and that are useful for treating neurological and psychiatric diseases and disorders.

5

BACKGROUND OF THE INVENTION

Recent advances in the elucidation of the neurophysiological roles of metabotropic glutamate receptors have established these receptors as promising drug targets in the therapy of acute and chronic neurological and psychiatric disorders and diseases. However, the major challenge to the realization of this promise has been the development of metabotropic glutamate receptor subtype-selective compounds.

Glutamate is the major excitatory neurotransmitter in the mammalian central nervous system (CNS). Glutamate produces its effects on central neurons by binding to and thereby activating cell surface receptors. These receptors have been divided into two major classes, the ionotropic and metabotropic glutamate receptors, based on the structural features of the receptor proteins, the means by which the receptors transduce signals into the cell, and pharmacological profiles.

The metabotropic glutamate receptors (mGluRs) are G protein-coupled receptors that activate a variety of intracellular second messenger systems following the binding of glutamate. Activation of mGluRs in intact mammalian neurons elicits one or more of the following responses: activation of phospholipase C; increases in phosphoinositide (PI) hydrolysis; intracellular calcium release; activation of phospholipase D; activation or inhibition of adenylyl

cyclase; increases or decreases in the formation of cyclic adenosine monophosphate (cAMP); activation of guanylyl cyclase; increases in the formation of cyclic guanosine monophosphate (cGMP); activation of phospholipase A₂; increases in arachidonic acid release; and increases or decreases in the activity of voltage- and ligand-gated ion channels. Schoepp *et al.*, *Trends Pharmacol. Sci.* 14:13 (1993); Schoepp, *Neurochem. Int.* 24:439 (1994); Pin *et al.*, *Neuropharmacology* 34:1 (1995).

Eight distinct mGluR subtypes, termed mGluR1 through mGluR8, have been identified by molecular cloning. *See, for example*, Nakanishi, *Neuron* 13:1031 (1994); Pin *et al.*, *Neuropharmacology* 34:1 (1995); Knopfel *et al.*, *J. Med. Chem.* 38:1417 (1995). Further receptor diversity occurs via expression of alternatively spliced forms of certain mGluR subtypes. Pin *et al.*, *PNAS* 89:10331 (1992); Minakami *et al.*, *BBRC* 199:1136 (1994); Joly *et al.*, *J. Neurosci.* 15:3970 (1995).

Metabotropic glutamate receptor subtypes may be subdivided into three groups, Group I, Group II, and Group III mGluRs, based on amino acid sequence homology, the second messenger systems utilized by the receptors, and by their pharmacological characteristics. Nakanishi, *Neuron* 13:1031 (1994); Pin *et al.*, *Neuropharmacology* 34:1 (1995); Knopfel *et al.*, *J. Med. Chem.* 38:1417 (1995).

Group I mGluRs comprise mGluR1, mGluR5, and their alternatively spliced variants. The binding of agonists to these receptors results in the activation of phospholipase C and the subsequent mobilization of intracellular calcium. Electrophysiological measurements have been used to demonstrate these effects. *in, for example*, *Xenopus* oocytes expressing recombinant mGluR1 receptors. *See, for example* Masu *et al.*, *Nature* 349:760 (1991); Pin *et al.*, *PNAS* 89:10331 (1992). Similar results have been achieved with oocytes expressing recombinant mGluR5 receptors. Abe *et al.*, *J. Biol. Chem.* 267:13361 (1992); Minakami *et al.*, *BBRC* 199:1136 (1994); Joly *et al.*, *J. Neurosci.* 15:3970 (1995). Alternatively, agonist activation of recombinant mGluR1 receptors expressed in Chinese hamster ovary (CHO) cells stimulates PI hydrolysis, cAMP formation, and arachidonic acid release as measured by standard biochemical assays. Aramori *et al.*, *Neuron* 8:757 (1992).

In comparison, activation of mGluR5 receptors expressed in CHO cells stimulates PI hydrolysis and subsequent intracellular calcium transients, but no stimulation of cAMP formation or arachidonic acid release is observed. Abe *et al.*, *J. Biol. Chem.* 267:13361 (1992). However, activation of mGluR5 receptors expressed in LLC-PK1 cells results in PI hydrolysis and increased cAMP formation. Joly *et al.*, *J. Neurosci.* 15:3970 (1995). The agonist potency profile for Group I mGluRs is quisqualate > glutamate = ibotenate > (2*S*,1'*S*,2'*S*)-2-carboxycyclopropylglycine (L-CCG-I) > (1*S*,3*R*)-1-aminocyclopentane-1,3-dicarboxylic acid (ACPD). Quisqualate is relatively selective for Group I receptors, as compared to Group II and Group III mGluRs, but it also is a potent activator of ionotropic AMPA receptors. Pin *et al.*, *Neuropharmacology* 34:1, Knopfel *et al.*, *J. Med. Chem.* 38:1417 (1995).

The lack of subtype-specific mGluR agonists and antagonists has impeded elucidation of the physiological roles of particular mGluRs, and the mGluR-associated pathophysiological processes that affect the CNS have yet to be defined. However, work with the available non-specific agonists and antagonists has yielded some general insights about the Group I mGluRs as compared to the Group II and Group III mGluRs.

Attempts at elucidating the physiological roles of Group I mGluRs suggest that activation of these receptors elicits neuronal excitation. Various studies have demonstrated that ACPD can produce postsynaptic excitation upon application to neurons in the hippocampus, cerebral cortex, cerebellum, and thalamus, as well as other brain regions. Evidence indicates that this excitation is due to direct activation of postsynaptic mGluRs, but it also has been suggested that activation of presynaptic mGluRs occurs, resulting in increased neurotransmitter release. Baskys, *Trends Pharmacol. Sci.* 15:92 (1992); Schoepp, *Neurochem. Int.* 24:439 (1994); Pin *et al.*, *Neuropharmacology* 34:1(1995).

Pharmacological experiments implicate Group I mGluRs as the mediators of this excitatory mechanism. The effects of ACPD can be reproduced by low concentrations of quisqualate in the presence of iGluR antagonists. Hu *et al.*, *Brain Res.* 568:339 (1991); Greene *et al.*, *Eur. J. Pharmacol.* 226:279 (1992). Two phenylglycine compounds known to activate mGluR1, namely (*S*)-3-hydroxyphenylglycine ((*S*)-3HPG) and (*S*)-3,5-dihydroxyphenylglycine ((*S*)-DHPG), also produce excitation. Watkins *et al.*, *Trends Pharmacol. Sci.* 15:33

(1994). In addition, the excitation can be blocked by (*S*)-4-carboxyphenylglycine ((*S*)-4CPG), (*S*)-4-carboxy-3-hydroxyphenylglycine ((*S*)-4C3HPG), and (+)-alpha-methyl-4-carboxyphenylglycine ((+)-MCPG), compounds known to be mGluR1 antagonists. Eaton *et al.*, *Eur. J. Pharmacol.* 244:195 (1993); Watkins
5 *et al.*, *Trends Pharmacol. Sci.* 15:333 (1994).

Metabotropic glutamate receptors have been implicated in a number of normal processes in the mammalian CNS. Activation of mGluRs has been shown to be required for induction of hippocampal long-term potentiation and cerebellar long-term depression. Bashir *et al.*, *Nature* 363:347 (1993); Bortolotto *et al.*,
10 *Nature* 368:740 (1994); Aiba *et al.*, *Cell* 79:365 (1994); Aiba *et al.*, *Cell* 79:377 (1994). A role for mGluR activation in nociception and analgesia also has been demonstrated. Meller *et al.*, *Neuroreport* 4: 879 (1993). In addition, mGluR activation has been suggested to play a modulatory role in a variety of other normal processes including synaptic transmission, neuronal development,
15 apoptotic neuronal death, synaptic plasticity, spatial learning, olfactory memory, central control of cardiac activity, waking, motor control, and control of the vestibulo-ocular reflex. For reviews, see Nakanishi, *Neuron* 13: 1031 (1994); Pin *et al.*, *Neuropharmacology* 34:1; Knopfel *et al.*, *J. Med. Chem.* 38:1417 (1995).

20 Metabotropic glutamate receptors also have been suggested to play roles in a variety of pathophysiological processes and disease states affecting the CNS. These include stroke, head trauma, anoxic and ischemic injuries, hypoglycemia, epilepsy, and neurodegenerative diseases such as Alzheimer's disease. Schoepp *et al.*, *Trends Pharmacol. Sci.* 14:13 (1993); Cunningham *et al.*, *Life Sci.* 54:135
25 (1994); Hollman *et al.*, *Ann. Rev. Neurosci.* 17:31 (1994); Pin *et al.*, *Neuropharmacology* 34:1 (1995); Knopfel *et al.*, *J. Med. Chem.* 38:1417 (1995). Much of the pathology in these conditions is thought to be due to excessive glutamate-induced excitation of CNS neurons. Because Group I mGluRs appear to increase glutamate-mediated neuronal excitation via postsynaptic mechanisms
30 and enhanced presynaptic glutamate release, their activation probably contributes to the pathology. Accordingly, selective antagonists of Group I mGluR receptors could be therapeutically beneficial, specifically as neuroprotective agents or anticonvulsants.

Preliminary studies assessing therapeutic potentials with the available mGluR agonists and antagonists have yielded seemingly contradictory results. For example, it has been reported that application of ACPD onto hippocampal neurons leads to seizures and neuronal damage (Sacaan *et al.*, *Neurosci. Lett.* 5 139:77 (1992); Lipparti *et al.*, *Life Sci.* 52:85 (1993). Other studies indicate, however, that ACPD inhibits epileptiform activity, and also can exhibit neuroprotective properties. Taschenberger *et al.*, *Neuroreport* 3:629 (1992); Sheardown, *Neuroreport* 3:916 (1992); Koh *et al.*, *Proc. Natl. Acad. Sci. USA* 88:9431 (1991); Chiamulera *et al.*, *Eur. J. Pharmacol.* 216:335 (1992); 10 Siliprandi *et al.*, *Eur. J. Pharmacol.* 219:173 (1992); Pizzi *et al.*, *J. Neurochem.* 61:683 (1993).

It is likely that these conflicting results are due to the lack of selectivity of ACPD, which causes activation of several different mGluR subtypes. In the studies finding neuronal damage it appears that Group I mGluRs were activated, 15 thereby enhancing undesirable excitatory neurotransmission. In the studies showing neuroprotective effects it appears that activation of Group II and/or Group III mGluRs occurred, inhibiting presynaptic glutamate release, and diminishing excitatory neurotransmission.

This interpretation is consistent with the observation that (*S*)-4C3HPG, a 20 Group I mGluR antagonist and Group II mGluR agonist, protects against audiogenic seizures in DBA/2 mice, while the Group II mGluR selective agonists DCG-IV and L-CCG-I protect neurons from NMDA- and KA-induced toxicity. Thomsen *et al.*, *J. Neurochem.* 62:2492 (1994); Bruno *et al.*, *Eur. J. Pharmacol.* 256:109 (1994); Pizzi *et al.*, *J. Neurochem.* 61:683 (1993).

25 Based on the foregoing, it is clear that currently available mGluR agonists and antagonists have limited value, due to their lack of potency and selectivity. In addition, most currently available compounds are amino acids or amino acid derivatives that have limited bioavailabilities, thereby hampering *in vivo* studies to assess mGluR physiology, pharmacology and their therapeutic potential. 30 Compounds that selectively inhibit activation of metabotropic glutamate receptor Group I subtypes should be useful for treatment of neurological disorders and diseases such as senile dementia, Parkinson's disease, Alzheimer's disease, Huntington's Chorea, pain, neuropathic pain, including neuropathic diseases states such as diabetic neuropathies, chemotherapy induced neuropathies, post-

herpetic neuralgia, and trigeminal neuralgia epilepsy, head trauma, anoxic and ischemic injuries, psychiatric disorders and diseases such as schizophrenia, depression, and anxiety, ophthalmological disorders and diseases such as various retinopathies, for example, diabetic retinopathies, glaucoma, and neurological disorders of a auditory nature such as tinnitus.

It is apparent, therefore, that identification of potent mGluR agonists and antagonists with high selectivity for individual mGluR subtypes, particularly for Group I receptor subtypes, are greatly to be desired.

SUMMARY OF THE INVENTION

It is an object of the present invention, therefore, to identify metabotropic glutamate receptor-active compounds which exhibit a high degree of potency and selectivity for individual metabotropic glutamate receptor subtypes, and to provide methods of making these compounds.

It is a further object of this invention to provide pharmaceutical compositions containing compounds which exhibit a high degree of potency and selectivity for individual metabotropic glutamate receptor subtypes, and to provide methods of making these pharmaceutical compositions.

It is yet another object of this invention to provide methods of inhibiting activation of an mGluR Group I receptor, and of inhibiting neuronal damage caused by excitatory activation of an mGluR Group I receptor.

It is still another object of the invention to provide methods of treating a disease associated with glutamate-induced neuronal damage.

To accomplish these and other objectives, the present invention provides potent antagonists of Group I metabotropic glutamate receptors. These antagonists may be represented by the formula I,

wherein R is an optionally substituted straight or branched chain alkyl, arylalkyl, cycloalkyl, or alkylcycloalkyl group preferably containing 5-12 carbon atoms. Ar is an optionally substituted aromatic, heteroaromatic, arylalkyl, or heteroaralkyl moiety containing up to 10 carbon atoms and up to 4 heteroatoms, and [linker] is $-(CH_2)_n-$, where n is 2-6, and wherein up to 4 CH_2 groups may independently be substituted with groups selected from the group consisting of

C₁-C₃ alkyl, CHOH, CO, O, S, SO, SO₂, N, NH, and NO. Two heteroatoms in the [linker] may not be adjacent except when those atoms are both N(as in -N=N- of -NH-NH-) or are N and S as in a sulfonamide. Two adjacent CH₂ groups in [linker] also may be replaced by a substituted or unsubstituted alkene or alkyne group. Pharmaceutically acceptable salts of the compounds also are provided.

In one embodiment of the invention, Ar comprises a ring system selected from the group consisting of benzene, thiazole, furyl, pyranlyl, 2H-pyrrolyl, thienyl, pyrrolyl, imidazolyl, pyrazolyl, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl benzothiazole, benzothiophenyl, benzimidazole, 3H-indolyl, indolyl, indazolyl, purinyl, quinoliziny, isoquinolyl, quinolyl, phthaliziny, naphthyridinyl, quinazolinyl, cinnolinyl, isothiazolyl, quinoxalinyl, indoliziny, isoindolyl, benzothienyl, benzofuranyl, isobenzofuranyl, and chromenyl rings. Ar optionally may independently be substituted with up to two C₁-C₃ alkyl groups, CF₃, -O-(CH₂)-O-, -O-(CH₂)₂-O-, OMe, or up to two halogen atoms, where halogen is selected from F, Cl, Br, and I.

In another embodiment of the invention, R contains 4, 5, 6, 7, 8, 9, 10 or 11 carbon atoms, where some or all of the hydrogen atoms on two carbon atoms optionally may be replaced with substituents independently selected from the group consisting of F, Cl, OH, OMe, =O, and -COOH.

In yet another embodiment [linker] comprises an amide, ester, or thioester group.

In a preferred embodiment, R comprises a moiety selected from the group consisting of substituted or unsubstituted phenylethyl, adamantyl, 2-adamantyl, (1S,2S,3S,5R)-isopinocampheyl, tricyclo[4.3.1.1(3,8)]undec-3-yl, (1S,2R,5S)-*cis*-myrtanyl, (1R,2R,4S)-isobornyl, (1R,2R,3R,5S)-isopinocampheyl, (1S,2S,5S)-*trans*-myrtanyl, (1R,2R,5R)-*trans*-myrtanyl, (1R,2S,4S)-bornyl, 1-adamantanemethyl, 3-noradamantyl, (1S,2S,3S,5R)-3-pinanemethyl, cyclooctyl, α,α -dimethylphenethyl, (S)-2-phenyl-1-propyl, cycloheptyl, 4-methyl-2-hexyl groups, 2,2,3,3,4,4,4-heptafluorobutyl, 4-ketoadamantyl, 3-phenyl-2-methylpropyl, 3,5-dimethyladamantyl, *trans*-2-phenylcyclopropyl, 2-methylcyclohexyl, 3,3,5-trimethylcyclohexyl, 2-(*o*-methoxyphenyl)ethyl, 2-(1,2,3,4-tetrahydronaphthyl), 4-phenylbutyl, 2-methyl-2-phenylbutyl, 2-(*m*-fluorophenyl)ethyl, 2-(*p*-fluorophenyl)ethyl, 2-(3-hydroxy-3-phenyl)propyl, (S)-

2-hydroxy-2-phenylethyl, (R)-2-hydroxy-2-phenylethyl, 2-(3-*m*-chlorophenyl-2-methyl)propyl, 2-(3-*p*-chlorophenyl-2-methyl)propyl, 4-*tert*-butyl-cyclohexyl, (S)-1-(cyclohexyl)ethyl, 2-(3-(3,4-dimethylphenyl)-2-methyl)propyl, 3,3-dimethylbutyl, 2-(5-methyl)hexyl, 1-myrtanyl, 2-bornyl, 3-pinanemethyl, 2,2,3,3,4,4,5,5-octafluoropentyl, *p*-fluoro- α,α -dimethylphenethyl, 2-naphthyl, 2-bornanyl, cyclohexylmethyl, 3-methylcyclohexyl, 4-methylcyclohexyl, *trans*-4-methylcyclohexyl, 3,4-dimethylcyclohexyl, 5-chloro-tricyclo[2.2.1]heptyl, *o*- α,α -dimethylphenethyl, 2-indanyl, 2-spiro[4.5]decyl, 2-phenylethyl, 1-adamantylethyl, 1-(1-bicyclo[2.2.1]hept-2-yl)ethyl, 2-(2-methyl-2-phenylpropyl), 2-(*o*-fluorophenyl)ethyl, 1-(cyclohexyl)ethyl, quinolyl, phenyl, and cyclohexyl.

In a still further embodiment of the invention, Ar comprises a group having the formula

where X^1 , X^2 , X^3 , and X^4 independently can be N or CH, provided that not more than two of X^1 , X^2 , X^3 , and X^4 can be N. In a preferred embodiment, X^1 is N, and/or X^2 is N. In another embodiment, X^3 is N. In still another embodiment, X^1 is CH and X^2 is N.

In yet another embodiment, Ar is an optionally substituted 2-pyridyl, 3-pyridyl, 2-quinolyl, 3-quinolyl, 6-quinolyl, 2-quinoxaliny, 2-benzothiophenyl, 2-benzofuranyl, 2-benzothiazole, 4-indolyl, 5-indolyl, 6-indolyl, or 7-indolyl moiety. The compound is selected from the group consisting of *N*-[2-(2-fluorophenyl)propyl]quinoxaline-2-carboxamide, *N*-(pentyl)quinoxaline-2-carboxamide, *N*-(cyclopentyl)quinoxaline-2-carboxamide, *N*-(1-adamantyl)indole-6-carboxamide, *N*-[2-(2-fluorophenyl)propyl]quinoline-3-carboxamide, *N*-[2-(2-fluorophenyl)propyl]quinoline-6-carboxamide, *N*-(*trans*-4-phenylcyclohexyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)indole-5-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-2-phenoxy nicotinamide, *N*-(6-quinolinyl)-4-methylcyclohexane-1-carboxamide, *N*-(1-adamantyl)-5-(2-cyanoethyl)nicotinamide, *N*-(1-methyl-4-phenylcyclohexyl)quinoxaline-2-carboxamide, (S)-*N*-(1-phenylethyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)indole-4-carboxamide, *N*-(*trans*-4-methylcyclohexyl)indole-6-carboxamide, *N*-(*trans*-4-methylcyclohexyl)furan-2-carboxamide, *N*-(*trans*-4-

- methylcyclohexyl)thiophene-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)benzothiophene-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)benzofuran-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-3-dimethylaminobenzamide, *N*-(*trans*-4-methylcyclohexyl)-2-methyl-1,8-naphthyridine-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-2-(trifluoromethyl)-1,6-naphthyridine-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-2-methyl-1,6-naphthyridine-3-carboxamide, *N*-(3-quinoliny)quinoxaline-2-carboxamide hydrochloride, *N*-(*trans*-4-methylcyclohexyl)-6-bromopicolinamide, *N*-(adamantyl)-5-(1-piperidine)nicotinamide, *N*-(*trans*-4-methylcyclohexyl)-2-carboxamidebenzothiazole, *N*-[2-(2,6-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-ethylenedioxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,8-difluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxy-7-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-(1-pyrazole)nicotinamide, *N*-[2-(2,3-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(2,4-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(2,5-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(3,4-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5,7-difluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-

(phenylether)picolinamide, and *N*-[2-(3,5-difluorophenyl)ethyl]quinoxaline-2-carboxamide, and pharmaceutically acceptable salts thereof.

In a preferred embodiment, the compound is selected from the group consisting of *N*-[2-(2-fluorophenyl)propyl]quinoxaline-2-carboxamide, *N*-
5 (pentyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-phenylcyclohexyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)indole-5-carboxamide, *N*-(6-quinolinyl)-4-methylcyclohexane-1-carboxamide, *N*-(1-methyl-4-phenylcyclohexyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)benzothiaphene-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)benzofuran-2-carboxamide, *N*-(3-quinolinyl)quinoxaline-2-carboxamide hydrochloride, *N*-(*trans*-4-methylcyclohexyl)-6-bromopicolinamide, *N*-(adamantyl)-5-(1-piperidine)nicotinamide, *N*-(*trans*-4-methylcyclohexyl)-2-carboxamidebenzothiazole, *N*-[2-(2,6-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoline-3-carboxamide,
15 *N*-(*trans*-4-methylcyclohexyl)-7-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-ethylenedioxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,8-difluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxy-7-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-(1-pyrazole)nicotinamide, *N*-[2-(2,3-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(2,4-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(2,5-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(3,4-

5 difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5,7-difluoroquinoline-3-carboxamide, and *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoline-3-carboxamide, and pharmaceutically acceptable salts thereof.

In another preferred embodiment, the compound is selected from the group consisting of *N*-[2-(2-fluorophenyl)propyl]quinoxaline-2-carboxamide, *N*-(pentyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-phenylcyclohexyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)indole-5-carboxamide, *N*-(6-quinolinyl)-4-methylcyclohexane-1-carboxamide, *N*-(1-methyl-4-phenylcyclohexyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)benzothiaphene-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)benzofuran-2-carboxamide, *N*-(3-quinolinyl)quinoxaline-2-carboxamide hydrochloride, *N*-(*trans*-4-methylcyclohexyl)-6-bromopicolinamide, *N*-(adamantyl)-5-(1-piperidine)nicotinamide, *N*-(*trans*-4-methylcyclohexyl)-2-carboxamidebenzothiazole, *N*-[2-(2,6-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-ethylenedioxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,8-difluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxy-7-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoxaline-2-carboxamide, and *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoxaline-2-carboxamide, and pharmaceutically acceptable salts thereof.

In another embodiment, the compound has the structure

where X^1 and X^2 independently are CH or N, X^3 is N or C-E, A, B, D, and E
 5 independently are selected from the group consisting of H, OMe, F, and CF_3 ,
 (preferably at least two of A, B, D, and E are H), or B and D together are $-O-$
 $(CH_2)_2-O-$ or $O-(CH_2)_2-O-$, R is selected from the group consisting of C_4-C_6 alkyl,

and

10

where K is H or Me, G^1 is H, Me, or phenyl, G^2 , K, L, and M
 independently are H or Me, n is 0, 1 or 2, and X^4 and X^5 independently are N or
 CH.

In accordance with another embodiment of the invention, there has been provided a pharmaceutical composition comprising a compound as set forth above, together with a pharmaceutically acceptable diluent or excipient.

5 In accordance with still another embodiment of the invention, there has been provided a method of making a compound as set forth above, comprising reacting a compound containing an activated carboxylic acid group with a compound containing an amine, hydroxyl, or thiol group.

10 In accordance with a still further embodiment of the invention, there has been provided a method of inhibiting activation of an mGluR Group I receptor, comprising treating a cell containing said mGluR Group I receptor with an effective amount of a compound as set forth above.

15 In yet another embodiment of the invention, there has been provided a method of inhibiting neuronal damage caused by excitatory activation of an mGluR Group I receptor, comprising treating neurons with an effective amount of a compound as set forth above.

In accordance with a further embodiment of the invention, there has been provided a method of treating a disease associated with glutamate-induced neuronal damage, comprising administering to a patient suffering from said disease an effective amount of a composition as set forth above.

20 Other objects, features and advantages of the present invention will become apparent from the following detailed description. It should be understood, however, that the detailed description and the specific examples, while indicating preferred embodiments of the invention, are given by way of illustration only, since various changes and modifications within the spirit and scope of the invention will become apparent to those skilled in the art from this
25 detailed description.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 shows illustrative compounds of the invention.

DETAILED DESCRIPTION

The invention provides compounds that are potent and selective antagonists of Group I metabotropic glutamate receptors. The compounds contemplated by the invention can be represented by the general formula I:

5

where R is a straight or branched chain alkyl, arylalkyl, or optionally substituted alicyclic group, and Ar is an optionally substituted aromatic, heteroaromatic, arylalkyl, or heteroaralkyl moiety. The [linker] moiety is a group that not only covalently binds to the Ar and R moieties, but also facilitates adoption of the correct spatial orientation by Ar and R to allow receptor binding.

Structure of the Ar moiety

15 The Ar moiety generally may contain up to ten carbon atoms, although the skilled artisan will recognize that Ar groups with more than ten carbon atoms are within the scope of the invention. Ar can be a monocyclic or fused bicyclic aryl, alkaryl, heteroaryl or heteroarylalkyl group. The ring systems encompassed by Ar can contain up to four heteroatoms, independently selected from the group consisting of N, S, and O. When Ar is a heteroaryl ring or ring system, it preferably contains one or two heteroatoms. At least one of the heteroatoms preferably is N.

Monocyclic Ar groups include, but are not limited to: phenyl, thiazoyl, furyl, pyranyl, 2H-pyrrolyl, thienyl, pyrrolyl, imidazoyl, pyrazoyl, pyridyl, pyrazinyl, pyrimidinyl, and pyridazinyl moieties. Fused bicyclic Ar groups include, but are not limited to: benzothiazole, benzimidazole, 3H-indolyl, indolyl, indazoyl, purinyl, quinolizinyl, isoquinolyl, quinolyl, phthalizinyl, naphthyridinyl, quinazolinyl, cinnolinyl, isothiazolyl, quinoxalinyl, indolizinyl, isoindolyl, benzothienyl, benzofuranyl, isobenzofuranyl, and chromenyl moieties. Ar preferably is a quinoxalinyl, quinolinyl, or pyridyl moiety.

30

Other Ar moieties include the 3,4-methylenedioxy and 3,4-dioxane rings. The Ar moiety optionally may independently be substituted with up to two C₁-C₃

alkyl groups, or up to two halogen atoms, where halogen is selected from F, Cl, Br, and I.

Structure of the R moiety

5 The R moiety generally may contain between four and eleven carbon atoms, although the skilled artisan will recognize that R moieties with 12, 13, 14, 15, or 16 carbon atoms will be possible. Although R can contain 4, 5 or 6 carbon atoms, preferably R contains at least 7 carbon atoms. Preferably, R is optionally substituted alkyl, cycloalkyl, cycloalkylmethyl, or optionally substituted phenylalkyl. Generally, some or all of the hydrogen atoms on up to two methine, methylene, or methyl groups of R may be replaced by substituents independently selected from the group consisting of F, Cl, OH, OMe, =O, and -COOH groups. However, more than two hydrogen atoms may be replaced with fluorine, and R may be perfluorinated.

15 Exemplary R moieties include, but are not limited to: phenylethyl, 2-phenylethyl, quinolyl, quinoxaliny, phenyl, cyclohexyl, adamantyl, 2-adamantyl, (1S,2S,3S,5R)-isopinocampheyl, tricyclo[4.3.1.1(3,8)]undec-3-yl, (1S,2R,5S)-*cis*-myrtanyl, (1R,2R,4S)-isobornyl, (1R,2R,3R,5S)-isopinocampheyl (1S,2S,5S)-*trans*-myrtanyl (1R,2R,5R)-*trans*-myrtanyl, (1R,2S,4S)-bornyl, 1-adamantanemethyl, 3-noradamantyl (1S,2S,3S,5R)-3-pinanemethyl, cyclooctyl, 20 dimethylphenethyl, (S)-2-phenyl-1-propyl, cycloheptyl, and 4-methyl-2-hexyl groups. Each of these exemplary R moieties may also be substituted in the manner set forth above.

Other preferred R groups include 2,2,3,3,4,4,4-heptafluorobutyl, 4-ketoadamantyl, 3-phenyl-2-methylpropyl, 3,5-dimethyladamantyl, *trans*-2-phenylcyclopropyl, 2-methylcyclohexyl, 3,3,5-trimethylcyclohexyl, 2-(*o*-methoxyphenyl)ethyl, 2-(1,2,3,4-tetrahydronaphthyl), 4-phenylbutyl, 2-methyl-2-phenylbutyl, 2-(*m*-fluorophenyl)ethyl, 2-(*p*-fluorophenyl)ethyl, 2-(3-hydroxy-3-phenyl)propyl, (S)-2-hydroxy-2-phenylethyl, (R)-2-hydroxy-2-phenylethyl, 2-(3-*m*-chlorophenyl-2-methyl)propyl, 2-(3-*p*-chlorophenyl-2-methyl)propyl, 4-*tert*-butyl-cyclohexyl, (S)-1-(cyclohexyl)ethyl, 2-(3-(3,4-dimethylphenyl)-2-methyl)propyl, 3,3-dimethylbutyl, 2-(5-methyl)hexyl, 1-myrtanyl, 2-bornyl, 3-pinanemethyl, 2,2,3,3,4,4,5,5-octafluoropentyl, *p*-fluoro- 2,2 - dimethylphenethyl, 2-naphthyl, 2-bornanyl, cyclohexylmethyl, 3-

methylcyclohexyl, 4-methylcyclohexyl, 3,4-dimethylcyclohexyl, 5-chloro-tricyclo[2.2.1]heptyl, *o*- , -dimethylphenethyl, 2-indanyl, 2-spiro[4.5]decyl, 2-phenylethyl, 1-adamantylethyl, 1-(1-bicyclo[2.2.1]hept-2-yl)ethyl, 2-(2-methyl-2-phenylpropyl), 2-(*o*-fluorophenyl)ethyl, 1-(cyclohexyl)ethyl, cyclohexyl, butan-2-
5 onyl, diphenylene, 3-carboxyladamantyl, 1-tetrahydronaphthelenyl, 1-indanyl, 4-methylcyclohexyl, *trans*-4-methylcyclohexyl 3,4-dimethylcyclohexyl, and 4,4-dimethylcyclohexyl moieties. Again, each of these exemplary R moieties may be substituted in the manner set forth above. When compounds may be present in alternative isomeric configurations, for example, *trans* or *cis*-4-methylcyclohexyl,
10 the R moiety may have any of the possible configurations. Similarly, if a compound exists as enantiomers, the R moiety can be either of the enantiomers, or may be a racemate.

Structure of the [linker] moiety

15 The [linker] moiety generally has the structure $-(CH_2)_n-$, where n is 2-6. Up to four CH_2 groups may independently be replaced with groups selected from the group consisting of a C_1 - C_3 alkyl group, $CHOH$, CO , O , S , SO , SO_2 , N , NH , and NO , provided that two heteroatoms may not be adjacent except when those atoms are both N (forming an $-N=N-$ or $-NH-NH-$ linkage), or those atoms
20 are N and S as in a sulfonamide. The sulfonamide can have either orientation with respect to the R and Ar moieties. Any two adjacent CH_2 groups also may be replaced by an alkene or alkyne group.

In a preferred embodiment, [linker] comprises an amide, ester, thioester, ketomethylene, ether, alkylether, ethylene, ethenyl, acetylenyl, hydroxyalkyl,
25 alkylsulfone, or alkyl alkylsulfoxide group. Preferably, [linker] is an $-O-(CH_2)_m-$, $-CO-Y-(CH_2)_m-$, or $-S(O)_n-(CH_2)_m-$ group, where Y is CH_2 , NH , O , or S , and m is 1-4, and n is 0-2. The [linker] moiety may have either one of two possible orientations with respect to the R and Ar groups. Thus, for example, the invention encompasses compounds having the configuration $R-O-(CH_2)_m-Ar$ and
30 $R-(CH_2)_m-O-R$.

Design and synthesis of mGluR Group I antagonists

In one embodiment, compounds according to the invention are esters and amides of monocyclic or fused bicyclic aromatic and heteroaromatic

carboxylic acids, phenols and amines. A particular embodiment, the compounds may be represented by the formula

- 5 where X^1 and X^2 independently are CH or N, X^3 is N or C-E, A, B, D, and E independently are selected from the group consisting of H, OMe, F, and CF_3 , (preferably at least two of A, B, D, and E are H), or B and D together are $-O-(CH_2)_2-O-$ or $-O-(CH_2)_2-O-$, R is selected from the group consisting of C_4 - C_6 alkyl,

10

where K is H or Me, G^1 is H, Me, or phenyl, G^2 , K, L, and M independently are H or Me, n is 0, 1 or 2, and X^4 and X^5 independently are N or CH.

In a preferred embodiment, the compounds may be represented by the Formulae II or III:

In Formulae II and III, Y can be either O, S, NH, or CH₂; and X¹, X², X³, and X⁴ independently can be N or CH. Preferably, one or two of X¹, X², X³, and X⁴ are N, and the remainder are CH. Preferred compounds contemplated by the invention have the formula IV or V, where R, Y and X¹ are as defined above.

In another preferred embodiment of the invention, the compounds have the Formulae VI or VII :

where R and Y are as defined above. In a first embodiment of the compounds of Formula VI, Y is N, R is an unsubstituted or monosubstituted 1,1,-dimethylphenylethylamine or 1,1-dimethylbenzylamine moiety, where the substituent preferably is an *o*-, *m*-, or *p*-chlorine or *p*-methoxy group. In a second embodiment of the compounds of Formula VI, Y is N, and R is an *o*-, *m*-, or *p*-methoxy substituted phenylethylamine. Compounds of the first and second embodiments appear to exhibit selectivity for the mGluR₁ receptor. In a third embodiment, of the compounds of Formula VI, Y is N, and R is an *o*, *m*, or *p*-

fluoro-substituted phenylethylamine. Compounds of the third embodiment appear not to discriminate between the mGluR₁ and mGluR₅ receptor subtypes.

In yet another preferred embodiment of the invention, the compounds have the Formulae VIII or IX:

VIII

IX

wherein X¹⁻⁴ and R are as defined above. In a first embodiment of compounds of Formula VIII, X¹ and X² are N, X³ and X⁴ are H, R is 1-adamantyl, and a substituent is present on the carbon atom ortho to both the linker and X². The substituent preferably is a halogen, such as chlorine, or an alkyl group, such as methyl. In a second embodiment of compound IX, R is 1-adamantyl. Compounds of these first and second embodiments appear to exhibit selectivity for the mGluR₁ receptor.

In still another embodiment, the compounds may have the Formulae X or XI, where Z is a pharmaceutically acceptable substituent. The skilled artisan will recognize that pharmaceutically acceptable Z groups are those groups that do not deleteriously reduce the receptor binding activity of the compound. Suitable Z groups include, but are not limited to halogen, lower alkyl, oxygen or amine, and their pharmaceutically acceptable derivatives including ethers, esters, and amides. Preferably, Z contains 0-4 carbon atoms.

X

XI

In each of the compounds described above, "alkyl" denotes both straight and branched chain alkyl. In other embodiments, R is adamantyl, the linker is -CO-CH₂-S-, and Ar is *m*- or *o*-alkyloxyphenyl, or 3,4-methylenedioxy or 3,4-dioxane.

In general, it appears that selective antagonism of the mGluR₁ receptor can be attained with compounds of the formula R-CO-N-Ar₁, where Ar₁ is an aromatic or heteroaromatic group such as a quinolinyl, quinoxaliny, thiazolidinyl, phenyl, benzimidazolyl, or pyridyl group.

5 The skilled artisan also will recognize that the compounds of the invention encompass salts of the compounds described above. These salts include pharmaceutically acceptable acid addition salts, pharmaceutically acceptable metal salts or optionally alkylated ammonium salts, such as hydrochloric, hydrobromic, hydroiodic, phosphoric, sulfuric, trifluoroacetic, malonic, succinic, citric,
10 mandelic, benzoic, cinnamic, methanesulfonic and similar ones, and include acids related to the pharmaceutically acceptable salts listed in the *Journal of Pharmaceutical Sciences*, 66:2 (1977) and incorporated herein by reference.

Examples of compounds according to the present invention are set forth in Table 1 below.

15

Preparation of mGluR Group I antagonists

The skilled artisan will recognize that mGluR Group I antagonists according to the invention may be prepared by methods that are well known in the art, using widely recognized techniques of organic chemistry. Suitable
20 reactions are described in standard textbooks of organic chemistry. For example, see March, Advanced Organic Chemistry, 2d ed., McGraw Hill (1977).

For example, the compounds generally may be prepared by formation of the [linker] moiety between two precursor compounds containing suitable Ar and R moieties. When the linker contains an amide linkage, the amide may be
25 formed using well known techniques, such as reaction between an amine and an acid chloride, or by reaction in the presence of a coupling reagent such as carbonyldiimidazole, or a carbodiimide such as, for example, 1,3-dicyclohexylcarbodiimide (DCC). Formation of ester and thioester linkages can be achieved in similar fashion.

30 When the [linker] moiety contains an ether linkage, the ether function also can be prepared using standard techniques. For example, ethers can be formed using the Mitsunobu reaction, where a primary alcohol function is displaced by another hydroxy group via activation using PPh₃ and diethylazodicarboxylate (DEAD). Thioether linkages may be prepared by displacement of a leaving

group such as halide with a thiolate anion, generated by deprotonation of a thiol group with base.

When the [linker] moiety contains a ketomethylene group, it can be formed by alkylation of a ketone enolate. Thus, for example, a methyl ketone
5 can be deprotonated using a strong base such as lithium diisopropylamide (LDA), followed by reaction with an alkyl halide. Alternatively, a ketomethylene function can be prepared via addition of an organometallic compound, such as a Grignard reagent, to an aldehyde, followed by oxidation of the resultant hydroxyl group to a ketone. Suitable reagents for oxidizing alcohols to ketones are well
10 known in the art.

[Linker] moieties containing other heteroatom groups also may be prepared using methods that are well known in the art. *N,N'*-Disubstituted hydrazine compounds may be prepared via reductive amination of hydrazones formed by reaction of a monosubstituted hydrazone with an aldehyde. *N,N'*-
15 Disubstituted azo compounds can be formed, for example, by oxidation of the corresponding hydrazines.

In most cases, the precursor Ar and R moieties are readily available, or may be prepared using straightforward techniques of organic chemistry. Many compounds are commercially available, for example, from Aldrich Chemical
20 Company, Milwaukee, WI. When the compounds are not commercially available, they may readily prepared from available precursors using straightforward transformations that are well known in the art.

For example, carboxylic acids may be converted into the corresponding acid chlorides by reaction with, for example, thionyl chloride or oxalyl chloride.
25 An example of such a reaction is provided below in Example 3. Compounds containing a hydroxy function may be converted into the corresponding amine by (i) conversion of the hydroxyl group into a leaving group, such as a sulfonic acid ester (such as a triflate, mesylate, or tosylate) or a halide, (ii) displacement with azide ion, and (iii) reduction of the resulting azide by, for example,
30 hydrogenation over a platinum oxide catalyst. An illustration of such a transformation is provided below in Example 12.

Testing of compounds for mGluR Group I antagonist activity

The pharmacological properties of the compounds of the invention can be analyzed using standard assays for functional activity. Examples of glutamate receptor assays are well known in the art, for example, see Aramori *et al.*,
5 *Neuron* 8:757 (1992); Tanabe *et al.*, *Neuron* 8:169 (1992). The methodology described in those publications is incorporated herein by reference.

Conveniently, the compounds of the invention may be studied using an assay that measures inhibition of intracellular calcium mobilization in cells expressing recombinant receptors that can bind the compounds. Suitable receptor
10 constructs are well known in the art and are also described, for example, in WO 97/05252, the contents of which are hereby incorporated by reference in their entirety.

Thus, HEK-293 cells (human embryonic kidney cells, available from the American Type Culture Collection, Rockville, MD, Accession Number CRL
15 1573) are stably transfected with a DNA construct expressing a recombinant receptor. The stably transfected cells are cultured in high glucose DMEM (Gibco 092) containing 0.8 mM glutamine, 10% FBS, and 200 μ M hygromycin B.

A protocol for measuring intracellular calcium mobilization in response to changes in extracellular calcium using the calcium-sensitive dye Fura has been
20 described previously. Briefly, HEK-293 cells, stably transfected with a DNA construct encoding a recombinant receptor, are loaded with Fura dye. The cells then are washed, resuspended, and maintained at 37 °C. The cells are diluted into cuvettes for recording fluorescent signals. Measurements of fluorescence are performed at 37 °C using standard methods, and concentrations of intracellular
25 Ca^{2+} are calculated using a dissociation constant (K_d) of 224 nM and applying equation:

$$[\text{Ca}^{2+}]_i = (F - F_{\min} / F_{\max}) \times K_d$$

30 where F is fluorescence at any particular time of interest, F_{\min} is determined by chelating all calcium available, therefore, no fura 2 is bound to calcium, and F_{\max} is determined by fully saturating all the fura 2 available with calcium.

A detailed protocol for testing the compounds of the invention is provided below at Example 15.

Preparation of pharmaceutical compositions containing mGluR antagonists, and their use in treating neurological disorders

5

The compounds of the invention are useful for treating neurological disorders or diseases. While these compounds will typically be used in therapy for human patients, they may also be used in veterinary medicine to treat similar or identical diseases.

10

In therapeutic and/or diagnostic applications, the compounds of the invention can be formulated for a variety of modes of administration, including systemic and topical or localized administration. Techniques and formulations generally may be found in Remington's Pharmaceutical Sciences: Drug Receptors and Receptor Theory, 18th ed., Mack Publishing Co. (1990).

15

The compounds according to the invention are effective over a wide dosage range. For example, in the treatment of adult humans, dosages from about 0.01 to about 1000 mg, preferably from about 0.5 to about 100 mg, per day may be used. A most preferable dosage is about 2 mg to about 70 mg per day. The exact dosage will depend upon the route of administration, the form in which the compound is administered, the subject to be treated, the body weight of the subject to be treated, and the preference and experience of the attending physician.

20

Pharmaceutically acceptable salts are generally well known to those of ordinary skill in the art, and may include, by way of example but not limitation, acetate, benzenesulfonate, besylate, benzoate, bicarbonate, bitartrate, bromide, calcium edetate, camsylate, carbonate, citrate, edetate, edisylate, estolate, esylate, fumarate, gluceptate, gluconate, glutamate, glycolylarsanilate, hexylresorcinate, hydrabamine, hydrobromide, hydrochloride, hydroxynaphthoate, iodide, isethionate, lactate, lactobionate, malate, maleate, mandelate, mesylate, mucate, napsylate, nitrate, pamoate (embonate), pantothenate, phosphate/diphosphate, polygalacturonate, salicylate, stearate, subacetate, succinate, sulfate, tannate, tartrate, or teoclate. Other pharmaceutically acceptable salts may be found in,

30

for example, Remington's Pharmaceutical Sciences; (18th ed.), Mack Publishing Co., Easton, PA (1990).

Preferred pharmaceutically acceptable salts include, for example, acetate, benzoate, bromide, carbonate, citrate, gluconate, hydrobromide, hydrochloride, maleate, mesylate, napsylate, pamoate (embonate), phosphate, salicylate, succinate, sulfate, or tartrate.

Depending on the specific conditions being treated, such agents may be formulated into liquid or solid dosage forms and administered systemically or locally. The agents may be delivered, for example, in a timed- or sustained-release form as is known to those skilled in the art. Techniques for formulation and administration may be found in Remington's Pharmaceutical Sciences; (18th ed.), Mack Publishing Co., Easton, PA (1990). Suitable routes may include oral, buccal, sublingual, rectal, transdermal, vaginal, transmucosal, nasal or intestinal administration; parenteral delivery, including intramuscular, subcutaneous, intramedullary injections, as well as intrathecal, direct intraventricular, intravenous, intraperitoneal, intranasal, or intraocular injections, just to name a few.

For injection, the agents of the invention may be formulated in aqueous solutions, preferably in physiologically compatible buffers such as Hank's solution, Ringer's solution, or physiological saline buffer. For such transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art.

Use of pharmaceutically acceptable carriers to formulate the compounds herein disclosed for the practice of the invention into dosages suitable for systemic administration is within the scope of the invention. With proper choice of carrier and suitable manufacturing practice, the compositions of the present invention, in particular, those formulated as solutions, may be administered parenterally, such as by intravenous injection. The compounds can be formulated readily using pharmaceutically acceptable carriers well known in the art into dosages suitable for oral administration. Such carriers enable the compounds of the invention to be formulated as tablets, pills, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated.

Pharmaceutical compositions suitable for use in the present invention include compositions wherein the active ingredients are contained in an effective

amount to achieve its intended purpose. Determination of the effective amounts is well within the capability of those skilled in the art, especially in light of the detailed disclosure provided herein.

In addition to the active ingredients, these pharmaceutical compositions
5 may contain suitable pharmaceutically acceptable carriers comprising excipients and auxiliaries which facilitate processing of the active compounds into preparations which can be used pharmaceutically. The preparations formulated for oral administration may be in the form of tablets, dragees, capsules, or solutions.

10 Pharmaceutical preparations for oral use can be obtained by combining the active compounds with solid excipients, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients are, in particular, fillers such as sugars, including lactose, sucrose, mannitol, or sorbitol; cellulose
15 preparations, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethyl-cellulose (CMC), and/or polyvinylpyrrolidone (PVP: povidone). If desired, disintegrating agents may be added, such as the cross-linked polyvinylpyrrolidone, agar, or alginic acid or a salt thereof such as sodium
20 alginate.

Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, talc, polyvinylpyrrolidone, carbopol gel, polyethylene glycol (PEG), and/or titanium dioxide, lacquer solutions, and suitable organic solvents or
25 solvent mixtures. Dye-stuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

Pharmaceutical preparations which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin, and a
30 plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active ingredients in admixture with filler such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds may be dissolved or

suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols (PEGs). In addition, stabilizers may be added.

The present invention, thus generally described, will be understood more readily by reference to the following examples, which are provided by way of illustration and are not intended to be limiting of the present invention.

EXAMPLES

General Experimental Methods

Capillary gas chromatographic and mass spectral data were obtained using a Hewlett-Packard (HP) 5890 Series II Gas Chromatograph coupled to an HP 5971 Series Mass Selective Detector [Ultra-2 Ultra Performance Capillary Column (crosslinked 5% PhMe silicone); column length, 25 m; column i.d., 0.20 mm; helium flow rate, 60 mL/min; injector temp., 250 °C; temperature program, 20 C/min from 125 to 325 °C for 10 min, then held constant at 325 °C for 6 min]. Thin-layer chromatography was performed using Analtech Uniplat 250- μ m silica gel HF TLC plates. UV light sometimes in conjunction with ninhydrin and Dragendorff's spray reagents (Sigma Chemical Co.) were used for detecting compounds on the TLC plates. Reagents used in reactions were purchased from the Aldrich Chemical Co. (Milwaukee, WI), Sigma Chemical Co. (Saint Louis, MO), Fluka Chemical Corp. (Milwaukee, WI), Fisher Scientific (Pittsburgh, PA), TCI America (Portland, OR), or Lancaster Synthesis (Windham, NH).

EXAMPLE 1: Preparation of *N*-(*trans*-4-methylcyclohexyl)quinoline-4-carboxamide (403)

A solution of quinoline-4-carboxylic acid (173 mg, 1 mmol), and 1,1'-carbonyldiimidazole (162 mg, 1 mmol) in dimethylformamide (2 mL) was heated at 50 °C for 1 hour. After this time, *trans*-4-methylcyclohexylamine hydrochloride (150 mg, 1 mmol), and *N,N*-diisopropylethylamine (0.262 mL, 1.5 mmol) were added and the mixture heated at 50 °C for 16 hours. The reaction mixture was cooled, and diluted with chloroform (10 mL). The organic solution was washed with water (3 x 10 mL), 1 *N* NaOH (10 mL), brine (10 mL), dried

over anhydrous MgSO_4 , filtered and concentrated to afford 156 mg (58 %) of 403:

rt=10.0 min.; m/z (rel. int.) 268 (M^+ , 30), 211 (4) 173 (100), 156 (71), 128 (74), 101 (26).

5

EXAMPLE 2: Preparation of *N*-(*trans*-4-methylcyclohexyl)quinoline-8-carboxamide (404)

A solution of quinoline-4-carboxylic acid (173 mg, 1 mmol), and 1,1'-carbonyldiimidazole (162 mg, 1 mmol) in dimethylformamide (2 mL) was heated at 50 °C for 1 hour. After this time, *trans*-4-methylcyclohexylamine hydrochloride (150 mg, 1 mmol), and *N,N*-diisopropylethylamine (0.262 mL, 1.5 mmol) were added and the mixture heated at 50 °C for 16 hours. The reaction mixture was cooled, and diluted with chloroform (10 mL). The organic solution was washed with water (3 x 10 mL), 1 *N* NaOH (10 mL), brine (10 mL), dried over anhydrous MgSO_4 , filtered and concentrated to afford 224 mg (84 %) of 404:

15

rt=10.2 min.; m/z (rel. int.) 268 (M^+ , 24), 267 (26), 211 (9) 173 (14), 156 (100), 129 (47), 112 (26).

20

EXAMPLE 3: Preparation of *N*-(*trans*-4-methylcyclohexyl)isoquinoline-1-carboxamide (405)

A solution of isoquinoline-1-carboxylic acid (346 mg, 2 mmol), and 1,1'-carbonyldiimidazole (325 mg, 2 mmol) in dimethylformamide (4 mL) was heated at 50 °C for 1 hour. After this time, *trans*-4-methylcyclohexylamine hydrochloride (300 mg, 2 mmol), and *N,N*-diisopropylethylamine (0.523 mL, 3 mmol) were added and the mixture heated at 50 °C for 16 hours. The reaction mixture was cooled, and diluted with ethyl acetate (20 mL). The organic solution was washed with water (3 x 15 mL), brine (20 mL), dried over anhydrous MgSO_4 , filtered and concentrated to afford 429 mg (80 %) of 405:

25

rt=9.19 min.; m/z (rel. int.) 268 (M^+ , 24), 211 (18), 197 (16), 173 (1), 156 (23), 128 (100), 112 (64).

30

EXAMPLE 4: Preparation of *N*-(*trans*-4-methylcyclohexyl)isoquinoline-3-carboxamide (406)

A solution of isoquinoline-3-carboxylic acid (346 mg, 2 mmol), and 1,1'-
5 carbonyldiimidazole (325 mg, 2 mmol) in dimethylformamide (4 mL) was heated
at 50 °C for 1 hour. After this time, *trans*-4-methylcyclohexylamine
hydrochloride (300 mg, 2 mmol), and *N,N*-diisopropylethylamine (0.523 mL, 3
mmol) were added and the mixture heated at 50 °C for 16 hours. The reaction
mixture was cooled, and diluted with ethyl acetate (20 mL). The organic solution
10 was washed with water (3 x 15 mL), brine (20 mL), dried over anhydrous
MgSO₄, filtered and concentrated to afford 377 mg (70 %) of 406:
rt=9.65 min.; m/z (rel. int.) 268 (M⁺, 9), 240 (6), 223 (16), 211 (17), 197
(13), 173 (22), 156 (55), 128 (100), 112 (38), 101 (15), 77 (10).

EXAMPLE 5: Preparation of *N*-(3-quinolinyl)quinoxaline-2-carboxamide hydrochloride (407)

A solution of 2-quinoxaloyl chloride (193 mg, 1 mmol) in
dichloromethane (20 mL) was treated with *trans*-4-methylcyclohexylamine
20 hydrochloride (150 mg, 1 mmol), and pyridine (0.2 mL) and stirred at ambient
temperature for 60 min. After this time the reaction mixture was diluted with
diethyl ether (50 mL). The organic solution was washed with 1 *N* NaOH (2 x 10
mL), brine (20 mL), dried over anhydrous MgSO₄. Treatment with excess 1 M
HCl in diethyl ether afforded 331 mg (98 %) of 407:
25 rt=12.61 min.; m/z (rel. int.) 300 (M⁺, 43), 271 (49), 245 (7), 171 (14), 129
(100), 116 (20), 102 (48), 89 (26), 76 (16).

EXAMPLE 6: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6-(1-pyrazole)nicotinamide (408)

30 A solution of 6-(1-pyrazole)nicotinic acid (96 mg, 0.51 mmol), and 1,1'-
carbonyldiimidazole (83 mg, 0.51 mmol) in dimethylformamide (2 mL) was
heated at 50 °C for 1 hour. After this time, *trans*-4-methylcyclohexylamine
hydrochloride (76 mg, 0.51 mmol), and *N,N*-diisopropylethylamine (0.135 mL,
35 0.77 mmol) were added and the mixture heated at 50 °C for 16 hours. The
reaction mixture was cooled, and diluted with chloroform (10 mL). The organic

solution was washed with water (4 x 10 mL), brine (10 mL), dried over anhydrous MgSO₄, filtered and concentrated to afford 75 mg (52 %) of 408:

rt=10.5 min.; m/z (rel. int.) 284 (M⁺, 18), 189 (48), 172 (100), 144 (13), 117 (23), 90 (10).

5

EXAMPLE 7: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6-bromopicolinamide (409)

A solution of 6-bromopicolinic acid (3 g, 14.85 mmol), and 1,1'-carbonyldiimidazole (2.41 g, 14.85 mmol) in dimethylformamide (30 mL) was heated at 50 °C for 2 hours. After this time, *trans*-4-methylcyclohexylamine hydrochloride (2.2 g, 14.85 mmol), and *N,N*-diisopropylethylamine (3.88 mL, 22.3 mmol) were added and the mixture heated at 50 °C for 16 hours. The reaction mixture was cooled, and diluted with ethyl acetate (300 mL). The organic solution was washed with water (4 x 300 mL). The aqueous extracts were washed with ethyl acetate (2 x 250 mL). The combined organic extracts were dried over anhydrous MgSO₄, filtered and concentrated. Chromatography of the crude product through a Biotage silica cartridge (15 x 4 cm i.d.) using ethyl acetate - hexane (1:3, containing 1% diethylamine) afforded 3.84 g (87%) of 409:

20

rt=8.36 min.; m/z (rel. int.) 298 (M⁺, 10), 296 (M⁺, 10), 239 (28), 241 (28), 201 (38), 203 (38), 184 (44), 186 (44), 158 (47), 156 (47), 112 (100).

25

EXAMPLE 8: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6-(phenoxy)picolinamide (410)

A nitrogen purged mixture of *N*-(*trans*-4-methylcyclohexyl)-6-bromopicolinamide (446 mg, 1.5 mmol), sodium phenoxide (209 mg, 1.8 mmol), and [1,1'-bis(diphenylphosphino)ferrocene]dichloropalladium(II) (1:1 complex with dichloromethane; 83 mg, 0.1 mmol) in toluene - tetrahydrofuran (9:1, 5 mL) was treated with bis(dibenzylideneacetone)palladium(II) (86 mg, 0.15 mmol) and the mixture heated at reflux overnight. After this time the reaction mixture was diluted with ethyl acetate (25 mL) and filtered. The organic solution was washed with water (2 x 20 mL), brine, dried over anhydrous MgSO₄, filtered and concentrated. Chromatography of the crude product on silica (2 mm,

35

chromatotron) with ethyl acetate - hexane (1:3, containing 1% diethylamine) afforded 97 mg (21%) of 410:

rt=8.36 min.; m/z (rel. int.) 310 (M⁺, 31), 265 (M⁺, 33), 253 (28), 239 (6), 215 (30), 198 (33), 185 (16), 170 (100), 112 (75), 77 (47).

5

EXAMPLE 9: Preparation of *N*-(adamantyl)-5-(1-piperidine)nicotinamide (411)

In a sealed tube, a solution of *N*-(adamantyl)-5-bromonicotinamide (335 mg 1 mmol), piperidine (2 mL), and 1,8-diazabicyclo[5.4.0]undec-7-ene (1 mL, 6.7 mmol) was heated at 200 °C for 5 days. Workup and chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of chloroform to 5% methanol in chloroform afforded 10 mg (3%) of 411:

rt=12.8 min.; m/z (rel. int.) 339 (M⁺, 100), 298 (3), 282 (15), 204 (10), 189 (12), 161 (15).

15

EXAMPLE 10: Preparation of *N*-(*trans*-4-methylcyclohexyl) benzothiazole-2-carboxamide (412)

Using the method of Skraup (Chem. Ber., 1922, 55, 1089-1090), a solution of potassium permanganate (4.75 g, 30 mmol) in water (100 mL) was treated with 2-methylbenzothiazole (2.2 g, 15 mmol) and the mixture heated at reflux for 2.5 hours. After this time the reaction was filtered hot and the filtrate allowed to cool. The solution was then extracted once with diethyl ether (200 mL) and the remaining aqueous phase acidified (pH 1) by the addition of concentrated HCl. The aqueous phase was then extracted with dichloromethane (1 x 200 mL, 2 x 100 mL). The combined organic extracts were dried over anhydrous MgSO₄, filtered and concentrated to afford 400 mg (15%) of benzothiazole-2-carboxylic acid.

25

A solution of benzothiazole-2-carboxylic acid (359 mg, 2 mmol), and 1,1'-carbonyldiimidazole (325 mg, 2 mmol) in dimethylformamide (4 mL) was heated at 50 °C for 1 hour. After this time, *trans*-4-methylcyclohexylamine hydrochloride (300 mg, 2 mmol), and *N,N*-diisopropylethylamine (0.525 mL, 3 mmol) were added and the mixture heated at 50 °C for 3 hours. The reaction mixture was cooled, and treated with 10% HCl (15 mL). The solution was extracted with ethyl acetate (15 mL). The ethyl acetate extract was then washed

30

35

with 10% HCl (15 mL), water (15 mL), and brine (15 mL). Dilution of the remaining solution with ethyl acetate (50 mL) and cooling to -20 °C afforded 25 mg (5 %) 412:

5 rt=9.62 min.; m/z (rel. int.) 274 (M⁺, 43), 229 (8), 217 (29), 203 (18), 179 (29), 162 (100), 135 (69), 134 (67), 112 (53).

EXAMPLE 11: Preparation of *N*-[2-(2,3-difluorophenyl)ethyl]quinoxaline-2-carboxamide (413)

10 **Preparation of 2,3-difluorophenylethylamine**

2,3-Difluorobenzyl bromide (5 g, 24.2 mmol) in acetonitrile (20 mL) was treated with 18-crown-6 (638 mg, 2.4 mmol) and potassium cyanide (5 g, 77 mmol). The reaction was heated at reflux for 5.5 hours. The reaction was diluted with diethyl ether (100 mL). The resulting organic solution was washed
15 with 1 *N* NaOH (3 x 25 mL), dried over anhydrous MgSO₄, filtered, and concentrated to afford 3.71 g of crude 2,3-difluorobenzyl cyanide.

Without further purification, 1 g of the crude nitrile was treated with borane-tetrahydrofuran complex (20 mL of 1 M) and heated at reflux for 1 hour. After this time the reaction mixture was cooled in an ice bath and treated
20 dropwise with 10% HCl (10 mL) followed by concentrated HCl (10 mL). The mixture was heated at reflux for 30 min and poured over ice. The mixture was basified by the addition of 10 *N* NaOH (30 mL). The mixture was equilibrated with diethyl ether (300 mL) and the aqueous phase removed. The organic solution was then extracted with 10% HCl (3 x 100 mL). The combined aqueous
25 extracts were basified using 10 *N* NaOH. The resulting basic solution was equilibrated with diethyl ether. The organic extract was separated, dried over anhydrous MgSO₄, filtered, and concentrated to afford crude product. Kugelrohr distillation yielded 424 mg (41 % from 2,3-difluorobenzyl bromide) of 2,3-difluorophenylethylamine:

30 rt=4.55 min.; m/z (rel. int.) 156 (M-1, 8), 140 (7), 135 (7), 127 (100), 109 (22), 107 (31), 101 (50), 81 (16), 77 (15), 75 (22).

***N*-[2-(2,3-difluorophenyl)ethyl]quinoxaline-2-carboxamide (413)**

A solution of 2,3-difluorophenylethylamine (212 mg, 1.35 mmol) in
35 dichloromethane (100 mL) was treated with 2-quinoxaloyl chloride (260 mg, 1.35

mmol), followed by pyridine (2 mL), followed by triethylamine (0.5 mL). The reaction was stirred 1 hour and diluted with diethyl ether (300 mL). The organic solution was washed with 10% HCl (4 x 100 mL), 1 N NaOH (4 x 100 mL), brine, dried over anhydrous MgSO₄, filtered and concentrated to solid.

5 Chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 25% ethyl acetate (in hexane) afforded 209 mg (49%) of 413:

rt=10.08 min.; m/z (rel. int.) 313 (M⁺, 25), 186 (67), 157 (33), 129 (100), 102 (36), 75 (11), 51 (5).

10

EXAMPLE 12: Preparation of *N*-[2-(2,4-difluorophenyl)ethyl]quinoxaline-2-carboxamide (414)

15 **Preparation of 2,4-difluorophenylethylamine**

2,4-Difluorophenylacetic acid (5 g, 29 mmol) in thionyl chloride (50 mL) was heated at reflux for 10 min and the excess thionyl chloride removed by distillation. The acid chloride in dichloromethane (10 mL) was added to a cooled (-78 °C) solution of NH₃ (20 mL) in dichloromethane (250 mL). Triethylamine (40 mL) was added and the reaction stirred at ambient temperature for 60 min. The solvents were then evaporated and the remaining solid dissolved in diethyl ether (500 mL). The organic solution was washed with 10% HCl (4 x 100 mL), 1 N NaOH (4 x 100 mL), dried over anhydrous MgSO₄, filtered and concentrated to afford 630 mg (13 %) of 2,4-difluorophenylacetamide.

25 Without further purification, the crude amide (630 mg) in tetrahydrofuran (100 mL) was treated with borane-tetrahydrofuran complex (10 mL of 1 M) and heated at reflux for 16 hours. After this time the reaction mixture was cooled in an ice bath and treated dropwise with 10% HCl (10 mL) followed by concentrated HCl (10 mL). The mixture was heated at reflux for 30 min, cooled, and basified by the addition of 10 N NaOH (30 mL). The mixture was
30 equilibrated with diethyl ether (50 mL) and the aqueous phase removed. The organic solution was then extracted with 10% HCl (4 x 50 mL). The combined aqueous extracts were basified using 10 N NaOH. The resulting basic solution was equilibrated with diethyl ether (50 mL). The organic extract was separated,

dried over anhydrous MgSO_4 , filtered, and concentrated to afford 147 mg (25%) of 2,4-difluorophenylethylamine.

rt=4.27 min.; m/z (rel. int.) 157 (M^+ , 10), 140 (7), 135 (9), 127 (100), 109 (23), 107 (31), 101 (47), 81 (16), 77 (13), 75 (17).

5

***N*-[2-(2,4-difluorophenyl)ethyl]quinoxaline-2-carboxamide (414)**

A solution of 2,4-difluorophenylethylamine (147 mg, 0.94 mmol) in dichloromethane (50 mL) was treated with 2-quinoxaloyl chloride (192 mg, 1 mmol), followed by pyridine (2 mL), followed by triethylamine (0.5 mL). The reaction was stirred 1 hour and diluted with diethyl ether (300 mL). The organic solution was washed with 10% HCl (4 x 100 mL), 1 *N* NaOH (4 x 100 mL), brine, dried over anhydrous MgSO_4 , filtered and concentrated to solid. Chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 20% ethyl acetate (in hexane) afforded 95 mg (32%) of 414:

15

rt=9.41 min.; m/z (rel. int.) 313 (M^+ , 12), 256 (2), 186 (43), 157 (31), 140 (36), 129 (100), 102 (35), 75 (11), 51 (6).

In a similar manner, the following substituted *N*-[2-(difluorophenyl)ethyl] quinoxaline-2-carboxamides were prepared:

20

EXAMPLE 13: Preparation of *N*-[2-(2,5-difluorophenyl)ethyl] quinoxaline-2-carboxamide (415)

2,5 -Difluorophenylacetic acid (5 g, 29 mmol) yielded 987 mg (48%) of 2,5-difluorophenylethylamine. 2,5-Difluorophenylethylamine (314 mg, 2 mmol), and 2-quinoxaloyl chloride (384 mg, 2 mmol) afforded 411 mg (66%) of 415:

25

rt=9.49 min.; m/z (rel. int.) 313 (M^+ , 25), 256 (3), 186 (47), 157 (33), 140 (25), 129 (100), 102 (35), 75 (11).

30

EXAMPLE 14: Preparation of *N*-[2-(2,6-difluorophenyl)ethyl] quinoxaline-2-carboxamide (416)

2,6 -Difluorophenylacetic acid (5 g, 29 mmol) yielded 744 mg (68%) of 2,6-difluorophenylethylamine. 2,6-Difluorophenylethylamine (314 mg, 2 mmol), and 2-quinoxaloyl chloride (384 mg, 2 mmol) afforded 481 mg (77%) of 416:

35

rt=9.48 min.; m/z (rel. int.) 313 (M⁺, 21), 256 (1), 186 (59), 157 (32), 140 (10), 129 (100), 102 (33), 75 (10).

EXAMPLE 15: Preparation of *N*-[2-(3,4-difluorophenyl)ethyl]quinoxaline-2-carboxamide (417)

3,4 -Difluorophenylacetic acid (5 g, 29 mmol) yielded 559 mg (46%) of 3,4-difluorophenylethylamine. 3,4-Difluorophenylethylamine (314 mg, 2 mmol), and 2-quinoxaloyl chloride (384 mg, 2 mmol) afforded 340 mg (54%) of 417:

rt=9.65 min.; m/z (rel. int.) 313 (M⁺, 12), 256 (3), 186 (54), 157 (28), 140 (43), 129 (100), 102 (37), 75 (11).

EXAMPLE 16: Preparation of *N*-[2-(3,5-difluorophenyl)ethyl]quinoxaline-2-carboxamide (418)

3,5-Difluorophenylacetic acid (5 g, 29 mmol) yielded 1.26 g (78%) of 3,5-difluorophenylethylamine. 3,5-Difluorophenylethylamine (314 mg, 2 mmol), and 2-quinoxaloyl chloride (384 mg, 2 mmol) afforded 298 mg (48%) of 418:

rt=9.84 min.; m/z (rel. int.) 313 (M⁺, 27), 256 (3), 186 (63), 157 (33), 140 (9), 129 (100), 102 (31), 76 (11).

EXAMPLE 17: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoline-3-carboxamide (419)

6-Methoxyquinoline-3-carboxylic acid was prepared from *p*-anisidine using the methods of Erickson (J.Med.Chem.,1979, 22, 7, 816-823). A solution of 6-methoxyquinoline-3-carboxylic acid hydrochloride (500 mg, 2.09 mmol) in thionyl chloride (25 mL) was heated at reflux for 1 hour. After this time the excess thionyl chloride was removed by distillation and the remaining solid dried under vacuum. The solid was suspended in dichloromethane (25 mL) and treated with *trans*-4-methylcyclohexylamine hydrochloride (368 mg, 2.46 mmol), pyridine (5 mL), and triethylamine (0.345 mL). The reaction was stirred at ambient temperature overnight. After this time the reaction mixture was diluted with diethyl ether (200 mL) and the resulting organic solution washed with 1 *N* NaOH (3 x 50 mL) and then brine (1x). The organic solution was then dried over anhydrous MgSO₄, filtered, and concentrated to a solid. Chromatography of the crude product through a Biotage silica cartridge (8 x 4 cm i.d.) using a

gradient of hexane to 50% ethyl acetate (in hexane) afforded 100 mg (16%) of 419:

rt=10.95 min.; m/z (rel. int.) 298 (M^+ , 3), 202 (56), 186 (66), 158 (100), 143 (16), 116 (34), 101 (22), 88 (25), 77 (45), 55 (44), 41 (85).

5

In a similar manner, the following substituted quinoline-3-carboxamides were prepared:

10 **EXAMPLE 18: Preparation of *N*-(*trans*-4-methylcyclohexyl)-7-methoxyquinoline-3-carboxamide (420)**

7-Methoxyquinoline-3-carboxylic acid hydrochloride (302 mg, 1.26 mmol) and *trans*-4-methylcyclohexylamine hydrochloride (188 mg, 1.26 mmol) afforded crude product. Chromatography of the crude product through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 50% ethyl acetate (in
15 hexane) afforded 21 mg of semi-pure product. Recrystallization (2x) from hot toluene afforded 4 mg (1%) of 420:

rt=10.95 min.; m/z (rel. int.) 298 (M^+ , 2), 202 (73), 186 (100), 158 (87), 143 (11), 131 (16), 116 (42), 101 (24), 88 (32), 77 (54), 55 (54), 41 (97).

20

EXAMPLE 19: Preparation of *N*-(*trans*-4-methylcyclohexyl)-8-methoxyquinoline-3-carboxamide (421)

8-Methoxyquinoline-3-carboxylic acid hydrochloride (250 mg, 1.04
25 mmol), oxalyl chloride, and *trans*-4-methylcyclohexylamine hydrochloride (156 mg, 1.04 mmol) afforded crude product. Chromatography of the crude product through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 75% ethyl acetate (in hexane) afforded 52 mg (17%) of 421:

rt=10.95 min.; m/z (rel. int.) 298 (M^+ , 100), 269 (24), 201 (63), 186 (91), 158
30 (48), 128 (39), 116 (12), 101 (11), 88 (5), 77 (7), 55 (5), 41 (8).

EXAMPLE 20: Preparation of *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoline-3-carboxamide (422) and *N*-(*trans*-4-methylcyclohexyl)-7-fluoroquinoline-3-carboxamide (423)

35

The methods of Erickson (J. Med. Chem., 1979, 22, 7, 816-823) were used to prepare a mixture of 5-fluoroquinoline-3-carboxylic acid hydrochloride and 7-

fluoroquinoline-3-carboxylic acid hydrochloride from *m*-fluoroaniline. A mixture of these two acids (500 mg, 2.2 mmol) in dichloromethane (25 mL) was treated with a solution of oxalyl chloride in dichloromethane (1.2 mL of 2 M, 2.4 mmol) followed by dimethylformamide (5 drops). The reaction was stirred overnight, filtered (Gelman Acrodisc CR PTFE 0.45 micron) and concentrated to a solid. The solid was dissolved in dichloromethane (25 mL) and then treated with *trans*-4-methylcyclohexylamine hydrochloride (330 mg, 2.2 mmol) followed by 4-*N,N'*-dimethylaminopyridine (1.22 g, 10 mmol). The reaction was stirred 1 hour at ambient temperature. Chromatography of the crude reaction mixture through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 30% ethyl acetate (in hexane) afforded three fractions. Recrystallization of fraction A from hot heptane afforded 30 mg of *N*-(*trans*-4-methylcyclohexyl)-7-fluoroquinoline-3-carboxamide (423):
rt=9.62 min.; m/z (rel. int.) 286 (M⁺, 18), 191 (97), 174 (100), 146 (77), 126 (12), 119 (20), 99 (10), 81 (10).

Recrystallization of fraction C from hot heptane (2x) and heptane/dichloromethane (1x) afforded 8 mg of *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoline-3-carboxamide (422):
rt=9.54 min.; m/z (rel. int.) 286 (M⁺, 15), 191 (95), 174 (100), 146 (80), 126 (20), 119 (23), 99 (12), 81 (12).

EXAMPLE 21: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoline-3-carboxamide (424)

6-Fluoroquinoline-3-carboxylic acid hydrochloride (500 mg, 2.2 mmol), oxalyl chloride, and *trans*-4-methylcyclohexylamine hydrochloride (330 mg, 2.2 mmol) afforded crude product. Chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 40% ethyl acetate (in hexane) afforded 56 mg (9%) of 424:
rt=9.54 min.; m/z (rel. int.) 286 (M⁺, 12), 191 (100), 174 (88), 146 (83), 126 (13), 119 (19), 99 (9), 81 (11).

EXAMPLE 22: Preparation of *N*-(*trans*-4-methylcyclohexyl)-8-fluoroquinoline-3-carboxamide (425)

8-Fluoroquinoline-3-carboxylic acid hydrochloride (500 mg, 2.2 mmol),
5 oxalyl chloride, and *trans*-4-methylcyclohexylamine hydrochloride (330 mg, 2.2 mmol) afforded crude product. Chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 40% ethyl acetate (in hexane) afforded 81 mg (13%) of 425:

10 rt=10.12 min.; m/z (rel. int.) 286 (M⁺, 17), 191 (100), 174 (83), 146 (67), 126 (20), 119 (7), 99 (7), 81 (7).

EXAMPLE 23: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoline-3-carboxamide (426)

15 Ethyl 4-chloro-6,7-methylenedioxyquinoline-3-carboxylate was prepared from 3,4-(methylenedioxy)aniline using the methods of Erickson (J.Med.Chem.,1979, 22, 7, 816-823).

Ethyl 4-chloro-6,7-methylenedioxyquinoline-3-carboxylate (18.5 g, 66.2 mmol) was dissolved in dioxane (100 mL) and treated with 50 mL 5 *N* NaOH and
20 heated at reflux for 2 hour. After this time the solution was concentrated on a rotary evaporator, cooled and extracted with dichloromethane (2 x 100 mL). The remaining aqueous solution was then acidified with concentrated HCl and the precipitate collected and dried to afford 7 g of crude 4-hydroxy-6,7-methylenedioxyquinoline-3-carboxylic acid hydrochloride.

25 The crude acid (500 mg) was treated with thionyl chloride (20 mL) and heated at reflux for 1 hour. After this time the excess thionyl chloride was removed by distillation and the remaining solid pumped dry. The solid was dissolved in dichloromethane and treated with *trans*-4-methylcyclohexylamine hydrochloride (150 mg, 1 mmol), followed by triethylamine (0.3 mLs). The
30 reaction was stirred 30 min and concentrated. The crude reaction mixture was partitioned between water (50 mL) and dichloromethane (4 x 25 mL). The combined dichloromethane extracts, were dried over anhydrous MgSO₄, filtered and concentrated to afford crude *N*-(*trans*-4-methylcyclohexyl)-4-chloro-6,7-methylenedioxyquinoline-3-carboxamide.

35 Without purification the amide was dissolved in hot toluene (25 mL) and diluted with ethanol (100 mL). *p*-Toluene sulfonic acid (400 mg) and 10% Pd on

carbon (200 mg) were added and the reaction shook under 60 p.s.i. H₂, for 75 min at ambient temperature. The reaction was filtered, washing with ethanol and chloroform. The solvents were evaporated and the remaining solid dissolved in dichloromethane (50 mL) and equilibrated with 1 N NaOH. The organic layer
5 was removed and the remaining aqueous phase extracted an additional two times with dichloromethane (2 x 50 mL). The combined organic washes were dried over anhydrous MgSO₄, filtered and concentrated to a solid (352 mg). Chromatography of this material through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 75% ethyl acetate (in hexane) afforded 147 mg
10 (47% from *trans*-4-methylcyclohexylamine) of 426:
rt=11.50 min.; m/z (rel. int.) 312 (M⁺, 16), 216 (79), 200 (100), 172 (60), 142 (10), 114 (19), 89 (10), 87 (10).

In a similar manner, the following substituted quinoline-3-carboxamides were
15 prepared:

EXAMPLE 24: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6,7-ethylenedioxyquinoline-3-carboxamide (427)

20 Ethyl 4-chloro-6,7-ethylenedioxyquinoline-3-carboxylate was prepared using the methods of Erickson (J. Med. Chem., 1979, 22, 7, 816-823).

Hydrolysis of ethyl 4-chloro-6,7-ethylenedioxyquinoline-3-carboxylate (19.8 g, 66.2 mmol) afforded 13 g of crude 4-hydroxy-6,7-methylenedioxy-quinoline-3-carboxylic acid hydrochloride.

25 The crude acid (500 mg), thionyl chloride, *trans*-4-methylcyclohexylamine hydrochloride (150 mg, 1 mmol), and triethylamine (0.3 mLs) afforded crude *N*-(*trans*-4-methylcyclohexyl)-4-chloro-6,7-ethylenedioxy-quinoline-3-carboxamide.

Dehalogenation of the crude amide was accomplished in 1:1 ethanol-acetic
30 acid (100 mL) with 10% Pd on carbon (200 mg) at 60 p.s.i. H₂ for 24 hours (ambient temperature). Workup and chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 60% ethyl acetate (in hexane) afforded 40 mg (12% from *trans*-4-methylcyclohexylamine) of 427:

35 rt=12.58 min.; m/z (rel. int.) 326 (M⁺, 18), 230 (100), 214 (96), 186 (55), 131 (13), 103 (11), 75 (8), 55 (8), 41 (10).

EXAMPLE 25: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6,8-difluoroquinoline-3-carboxamide (428)

Ethyl 4-chloro-6,8-difluoroquinoline-3-carboxylate was prepared from 2,4-difluoroaniline (12.9 g, 100 mmol) using the methods of Erickson
5 (J.Med.Chem.,1979, 22, 7, 816-823).

Hydrolysis of ethyl 4-chloro-6,8-difluoroquinoline-3-carboxylate afforded 10.5 g of crude 4-hydroxy-6,8-difluoroquinoline-3-carboxylic acid hydrochloride. The crude acid (2 g.), thionyl chloride, *trans*-4-methylcyclohexylamine hydrochloride (748 mg, 5 mmol), and triethylamine (0.3
10 mLs) afforded crude *N*-(*trans*-4-methylcyclohexyl)-4-chloro-6,8-difluoroquinoline-3-carboxamide.

Dehalogenation of the crude amide was accomplished in 5:1 tetrahydrofuran-triethylamine (300 mL) with 10% Pd on carbon (2.25 g) at 60 p.s.i. H₂ for 4 hours (ambient temperature). Workup and chromatography
15 through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 20% ethyl acetate (in hexane) afforded 150 mg (49% from *trans*-4-methylcyclohexylamine) of 428:

rt=9.66 min.; m/z (rel. int.) 304 (M⁺, 14), 209 (100), 192 (84), 164 (76), 144 (22), 87 (7), 81 (12).
20

EXAMPLE 26: Preparation of *N*-(*trans*-4-methylcyclohexyl)-5,7-difluoroquinoline-3-carboxamide (429)

Ethyl 4-chloro-5,7-difluoroquinoline-3-carboxylate was prepared from
25 3,5-difluoroaniline (12.9 g, 100 mmol) using the methods of Erickson (J.Med.Chem.,1979, 22, 7, 816-823).

Hydrolysis of ethyl 4-chloro-5,7-difluoroquinoline-3-carboxylate afforded 9.6 g of crude 4-hydroxy-6,8-difluoroquinoline-3-carboxylic acid hydrochloride.

The crude acid (500 mg.), thionyl chloride, *trans*-4-methylcyclohexylamine hydrochloride (250 mg, 1.67 mmol), and triethylamine
30 (0.3 mLs) afforded crude *N*-(*trans*-4-methylcyclohexyl)-4-chloro-5,7-difluoroquinoline-3-carboxamide.

Dehalogenation of the crude amide was accomplished in 4:1 tetrahydrofuran-triethylamine (75 mL) with 10% Pd on carbon (300 mg) under a
35 H₂ balloon for 35 min (ambient temperature). Workup and chromatography

through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 30% ethyl acetate (in hexane) afforded 134 mg (26% from *trans*-4-methylcyclohexylamine) of 429:

5 rt=9.23 min.; m/z (rel. int.) 304 (M⁺, 14), 209 (94), 192 (100), 164 (65), 144 (18), 137 (14), 81 (16).

EXAMPLE 27: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6-methoxy-7-fluoroquinoline-3-carboxamide (430)

10 Ethyl 4-chloro-6-methoxy-7-fluoroquinoline-3-carboxylate was prepared from 3-fluoro-*p*-anisidine (14.1 g, 100 mmol) using the methods of Erickson (J.Med.Chem.,1979, 22, 7, 816-823).

Hydrolysis of ethyl 4-chloro-6-methoxy-7-fluoroquinoline-3-carboxylate afforded 13 g of crude 4-hydroxy-6-methoxy-7-fluoroquinoline-3-carboxylic acid
15 hydrochloride.

The crude acid (1 g.), thionyl chloride, *trans*-4-methylcyclohexylamine hydrochloride (150 mg, 1 mmol), and triethylamine (0.3 mLs) afforded crude *N*-(*trans*-4-methylcyclohexyl)-4-chloro-6-methoxy-7-fluoroquinoline-3-carboxamide.

20 Dehalogenation of the crude amide was accomplished in 1:1 tetrahydrofuran-dichloromethane (100 mL) with 10% Pd on carbon (300 mg) at 60 p.s.i. H₂ for 4 hours (ambient temperature). Workup and chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 40% ethyl acetate (in hexane) afforded 150 mg (47% from *trans*-4-methylcyclohexylamine) of 430:

25 rt=10.77 min.; m/z (rel. int.) 316 (M⁺, 16), 221 (60), 220 (58), 204 (100), 176 (69), 161 (12), 133 (12), 101 (8), 81 (6), 55 (6), 41 (12).

In a similar manner, the following substituted quinoline-3-carboxamides were
30 prepared:

EXAMPLE 28: Preparation of *N*-(*trans*-4-methylcyclohexyl)-7-trifluoromethylquinoline-3-carboxamide (431)

35 4-Hydroxy-7-trifluoromethyl-3-carboxylic acid (514 mg, 2 mmol), thionyl chloride, *trans*-4-methylcyclohexylamine hydrochloride (225 mg, 1.5 mmol),

and triethylamine (2 mL) afforded crude product. Chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 40% ethyl acetate (in hexane) afforded 514 mg (92%) of *N*-(*trans*-4-methylcyclohexyl)-4-chloro-7-trifluoromethylquinoline-3-carboxamide:

5 rt=9.74 min.; m/z (rel. int.) 370 (M⁺, 8), 275 (100), 258 (80), 230 (42), 203 (13), 81 (23).

 The amide (253 mg, 0.68 mmol) in 3:1 tetrahydrofuran-dichloromethane (75 mL) containing 10% Pd on carbon (150 mg) was hydrogenated at 40 p.s.i. H₂ for 10 min (ambient temperature). Filtration of the reaction mixture and
10 chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 20% ethyl acetate (in hexane) afforded 40 mg (12%) of 431:

 rt=9.38 min.; m/z (rel. int.) 336 (M⁺, 13), 317 (3), 241 (100), 224 (85), 196 (90), 176 (12), 169 (23), 81 (17).

15

EXAMPLE 29: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoline-3-carboxamide (432)

 4-Hydroxy-6-trifluoromethyl-3-carboxylic acid (514 mg, 2 mmol), thionyl
20 chloride, *trans*-4-methylcyclohexylamine hydrochloride (225 mg, 1.5 mmol), and triethylamine (2 mL) afforded crude *N*-(*trans*-4-methylcyclohexyl)-4-chloro-6-trifluoromethylquinoline-3-carboxamide:

 m/z (rel. int.) 370 (M⁺, 10), 351 (2), 335 (2), 275 (100), 258 (81), 230 (42), 203 (18), 97 (16), 81 (23).

25 The crude amide in 3:1 tetrahydrofuran-dichloromethane (100 mL) containing 10% Pd on carbon (250 mg) was hydrogenated at 20 p.s.i. H₂ for 4 hours (ambient temperature). Filtration of the reaction mixture and chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 30% ethyl acetate (in hexane) afforded 100 mg (20% from
30 *trans*-4-methylcyclohexylamine) of 432:

 rt=9.33 min.; m/z (rel. int.) 336 (M⁺, 12), 317 (2), 241 (100), 224 (84), 196 (63), 176 (40), 169 (23), 81 (20).

EXAMPLE 30: Preparation of *N*-(*trans*-4-methylcyclohexyl)-8-trifluoromethylquinoline-3-carboxamide (433)

4-Hydroxy-8-trifluoromethyl-3-carboxylic acid (514 mg, 2 mmol), thionyl
chloride, *trans*-4-methylcyclohexylamine hydrochloride (225 mg, 1.5 mmol),
and triethylamine (2 mL) afforded crude *N*-(*trans*-4-methylcyclohexyl)-4-chloro-
8-trifluoromethylquinoline-3-carboxamide:

m/z (rel. int.) 370 (M^+ , 10), 351 (2), 335 (2), 275 (100), 258 (76), 230 (33),
210 (29), 203 (13), 81 (33).

The crude amide in 3:1 tetrahydrofuran-dichloromethane (100 mL)
containing 10% Pd on carbon (250 mg) was hydrogenated at 20 p.s.i. H_2 for 15
min (ambient temperature). An additional quantity of Pd on carbon (250 mg)
was added and the reaction hydrogenated at 20 p.s.i. H_2 for 15 min (ambient
temperature). Filtration of the reaction mixture and chromatography through a
Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 30% ethyl
acetate (in hexane) afforded 35 mg (7% from *trans*-4-methylcyclohexylamine) of
433:

rt=9.83 min.; *m/z* (rel. int.) 336 (M^+ , 14), 317 (2), 241 (100), 224 (80), 196
(64), 176 (40), 169 (23), 81 (20).

EXAMPLE 31: Preparation of *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoxaline-2-carboxamide (434)

Synthesis of *N*-(4-fluoro-2-nitrophenyl)alanine ethyl ester.

Using the methods of Lumma (*J. Med. Chem.*, **1981**, 24, 93-101), a
suspension of DL-alanine ethyl ester hydrochloride (24.1 g, 157 mmol) in
dichloromethane (200 mL) was treated with 16 mL of 10 *N* NaOH (160 mmol)
and the mixture stirred 15 min. Anhydrous $MgSO_4$ was added and the mixture
stirred until a thick paste formed. The dichloromethane was decanted from the
aqueous paste and further dried over anhydrous $MgSO_4$. The organic solution
was filtered, and concentrated to approximately 50 mL in volume. This was
added to a solution of 2,5-difluoronitrobenzene (25 g, 157 mmol) in toluene (50
mL). The reaction was heated at reflux until the total volume was less than 50
mL. A reflux condenser was added to the reaction flask and the solution heated
at reflux for 2 hours. After this time, triethylamine (22 mL, 158 mmol) was
added and the reaction heated at reflux for an additional 1 hour. The reaction

mixture was then cooled, diluted with chloroform and adsorbed on to silica. Chromatography through silica (20 x 4.5 cm i.d.) using a gradient of hexane to ethyl acetate afforded 17.4 g (43%) of *N*-(4-fluoro-2-nitrophenyl)alanine ethyl ester:

5 rt=8.40 min; m/z (rel. int.) 256 (8, M⁺), 183 (100), 137 (21), 122 (12), 109 (14), 95 (10), 83 (9).

Synthesis of 7-fluoro-3-methyl-3,4-dihydro-2(1*H*)-ketoquinoxaline

Using the methods of Lumma (*J. Med. Chem.*, **1981**, *24*, 93-101), a
10 solution of *N*-(4-fluoro-2-nitrophenyl)alanine ethyl ester (17.4 g, 67.9 mmol) in ethanol was treated with mossy tin (35 g, 295 mmol) followed by concentrated HCl (75 mL). As the vigorous reflux subsided, the reaction was heated to, and maintained at reflux and for 1 hour. The solution was decanted from the remaining tin and concentrated to afford 3.69 g of crude 7-fluoro-3-methyl-3,4-
15 dihydro-2(1*H*)-ketoquinoxaline:

rt=8.18 min; m/z (rel. int.) 180 (M⁺, 29), 165 (42), 137 (100), 110 (17), 83 (15).

Synthesis of 7-fluoro-3-methyl-2(1*H*)-quinoxalinone

20 Using the methods of Lumma (*J. Med. Chem.*, **1981**, *24*, 93-101), the crude 7-fluoro-3-methyl-3,4-dihydro-2(1*H*)-ketoquinoxaline (3.69 g) in ethanol (500 mL) was treated with 30% H₂O₂ (25 mL), and 1 *N* NaOH (50 mL) and the mixture heated at reflux overnight. After this time the reaction was cooled, acidified (pH ~ 3) with concentrated HCl, and the resulting solution extracted
25 with chloroform (4 x 300 mL). The combined organic washes were dried over anhydrous MgSO₄, filtered, and concentrated to afford 3.2 g of crude 7-fluoro-3-methyl-2(1*H*)-quinoxalinone:

rt=8.42 min; m/z (rel. int.) 178 (M⁺, 45), 150 (71), 149 (100), 122 (12), 108 (18).

30

Synthesis of 2-chloro-3-methyl-7-fluoroquinoxaline

Without purification, 3.2 g of crude 7-fluoro-3-methyl-2(1*H*)-quinoxalinone in phosphorous oxychloride (50 mL) was headed at 100 °C for 30 min, then poured over ice. The mixture was basified (pH ~ 10) with 10 *N*
35 NaOH and the resulting solution extracted with chloroform (4 x 300 mL). The

combined organic washes were dried over anhydrous MgSO_4 , filtered, and concentrated to afford 6.47 g of crude 2-chloro-3-methyl-7-fluoroquinoxaline:

rt=6.23 min; m/z (rel. int.) 198 (M^+ , 13), 196 (M^+ , 40), 161 (100), 134 (12), 120(20), 100 (12).

5

Synthesis of 2-methyl-6-fluoroquinoxaline

Without purification, 6.47 g of crude 2-chloro-3-methyl-7-fluoroquinoxaline, in a mixture of chloroform (200 mL), methanol (50 mL), and triethylamine (200 mL), was treated with palladium on carbon (2 g, 10% Pd) and stirred under a balloon of hydrogen for 45 min at ambient temperature. After this time the reaction was filtered and concentrated. Chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 20% ethyl acetate (in hexane) afforded 2.03 g (18% from of *N*-(4-fluoro-2-nitrophenyl)alanine ethyl ester) of 2-methyl-6-fluoroquinoxaline

rt=5.24 min; m/z (rel. int.) 162 (M^+ , 96), 135 (100), 94 (49).

10

15

Synthesis of 6-fluoroquinoxaline-2-carboxaldehyde

Using the method of Kepez (*Monatshefte fur Chemie*, 1989, 120, 127-130), a solution of 2-methyl-6-fluoroquinoxaline (225 mg 1.39 mmol) in ethyl acetate (30 mL) was treated with selenium dioxide (2.5 g) and the reaction mixture heated at reflux for 36 hours. The reaction was filtered hot and concentrated. Chromatography through a Biotage silica cartridge (8 x 4 cm i.d.) using a gradient of hexane to 10 % ethyl acetate (in hexane) afforded 71 mg (29 %) of 6-fluoroquinoxaline-2-carboxaldehyde.

20

25

rt=5.84 min; m/z (rel. int.) 176 (M^+ , 92), 148 (76), 121 (100), 100 (33), 94 (63), 75 (17).

Synthesis of 6-fluoroquinoxaline-2-carboxylic acid

Using the method of Dodd (*Synthesis*, 1993, 295-297), a solution of 6-fluoroquinoxaline-2-carboxaldehyde (71 mg, 0.4 mmol) in formic acid (2 mL) was cooled in an ice bath and treated with hydrogen peroxide (2 mL of 30 %). The reaction was stirred in the ice bath for 3 hours. After this time the reaction mixture was diluted with 10% HCl (25 mL) and extracted with dichloromethane (4 x 25 mL). The combined organic extracts were dried over anhydrous MgSO_4 ,

30

filtered and concentrated to afford 35 mg (45%) of 6-fluoroquinoxaline-2-carboxylic acid.

***N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoxaline-2-carboxamide (434)**

5 A solution of 6-fluoroquinoxaline-2-carboxylic acid (35 mg, 0.18 mmol) in dimethylformamide (4 mL) was treated with 1,1'-carbonyldiimidazole (29 mg, 0.18 mmol) and the reaction stirred for 16 hours at ambient temperature. After this time the reaction mixture was treated with *trans*-4-methylcyclohexylamine hydrochloride (27 mg, 0.18 mmol) and *N,N*-diisopropylethylamine (0.05 mL, 0.29 mmol) and the reaction stirred 2 hours at
10 ambient temperature. The solvent was evaporated to a solid (700 mg). The solid was dissolved in chloroform (10 mL) and added to diethyl ether (30 mL). The organic solution was washed with water (1 x 25 mL) and brine. The remaining organic solution was dried over anhydrous MgSO₄, filtered, and concentrated to a
15 solid (35 mg). HPLC (10 micron silica, 250 x 20 mm i.d.) of this material using a gradient of chloroform to 10 % ethanol (in chloroform) afforded 20 mg (39%) of 434:

Rt=8.88 min; m/z (rel. int.) 287 (M⁺, 23), 259 (1), 230 (9), 216 (3), 192 (22), 175 (36), 147 (100), 120 (28), 112 (47).

20

EXAMPLE 32: *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoxaline-2-carboxamide

Using the procedures for compound 435 and those of Lumma (*J. Med. Chem.*, **1981**, 24, 93-101), Kepez (*Monatshefte fur Chemie*, **1989**, 120, 127-
25 130), and Dodd (*Synthesis*, **1993**, 295-297), 2,6-difluoronitrobenzene afforded compound 435:

Rt=8.85 min; m/z (rel. int.) 287 (M⁺, 54), 259 (1), 230 (14), 216 (6), 192 (27), 175 (26), 147 (100), 127 (20), 121 (15), 120 (18), 112 (40).

30 **EXAMPLE 33: *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoxaline-2-carboxamide**

Using the procedures for compound 435 and those of Lumma (*J. Med. Chem.*, **1981**, 24, 93-101), Kepez (*Monatshefte fur Chemie*, **1989**, 120, 127-130), and Dodd (*Synthesis*, **1993**, 295-297), 4-fluoro-3-nitrobenzotrifluoride afforded
35 compound 436:

Rt=8.64 min; m/z (rel. int.) 337 (M⁺, 27), 318 (3), 280 (10), 242 (24), 225 (17), 197 (100), 170 (28), 112 (62).

EXAMPLE 34: *N*-(trans-4-methylcyclohexyl)-6-methoxyquinoxaline-2-carboxamide

Treatment of compound 434 (*N*-(trans-4-methylcyclohexyl)-6-fluoroquinoxaline-2-carboxamide) with a solution of sodium methoxide in methanol at ambient temperature afforded compound 347:

Rt=10.26 min; m/z (rel. int.) 299 (M⁺, 36), 271 (3), 242 (3), 228 (3), 203 (13), 187 (33), 159 (100), 117 (25), 112 (100).

EXAMPLE 35: *N*-(trans-4-methylcyclohexyl)-6,7-methylenedioxyquinoxaline-2-carboxamide

Using the method of Cai (*J. Med. Chem.*, **1997**, *40*, 730-738), commercially available (Sigma) benzo[1,3]dioxole-5,6-diamine and oxalic acid in 2 *N* HCl with heating (2.5 hours) will generate 6,7-methylenedioxy-3-methyl-2(1*H*)-quinoxalinone). Using the procedure for compound 435, treatment of 6,7-methylenedioxy-3-methyl-2(1*H*)-quinoxalinone) will afford 2-chloro-3-methyl-6,7-methylenedioxy-quinoxaline. Using the procedure for compound 435, catalytic hydrogenation of 2-chloro-3-methyl-6,7-methylenedioxy-quinoxaline will afford 3-methyl-6,7-methylenedioxyquinoxaline. Using the procedure for compound 435 and the method of Kepez (*Monatshefte fur Chemie*, **1989**, *120*, 127-130), oxidation of 3-methyl-6,7-methylenedioxyquinoxaline with selenium dioxide will afford 6,7-methylenedioxyquinoxaline-2-carboxaldehyde. Using the procedure for compound 435 and the method of Dodd (*Synthesis*, **1993**, 295-297), oxidation of 6,7-methylenedioxyquinoxaline-2-carboxaldehyde with formic acid and hydrogen peroxide will afford 6,7-methylenedioxyquinoxaline-2-carboxylic acid. Using the procedure for compound 435, activation of 6,7-methylenedioxyquinoxaline-2-carboxylic acid with 1 equivalent 1,1'-carbonyldiimidazole followed by treatment with 1 equivalent *trans*-4-methylcyclohexylamine hydrochloride and 1.5 equivalents *N,N*-diisopropylethylamine will afford crude product. Chromatography of this crude product through a Biotage silica cartridge, using a gradient of hexane to ethyl acetate and/or HPLC (10 micron silica, 250 x 20 mm i.d.) using a gradient of chloroform to 10 % ethanol (in chloroform) will afford purified product.

EXAMPLE 36: Assay of mGluR Group I antagonist activity

HEK-293 cells expressing a recombinant receptor as described in WO 97/05252 were loaded with 2 μ M Fura-2 acetoxymethylester by incubation for 30-40 minutes at 37 °C in SPF-PCB (126 mM NaCl, 5 mM KCl, 1 mM MgCl₂,
5 20 mM Na-HEPES, 1.0 mM CaCl₂, 1 mg/mL glucose, and 0.5% BSA, pH 7.4).

The cells were washed 1-2 times in SPF-PCB, resuspended to a density of 4-5 million cells/mL and kept at 37 °C in a plastic beaker. For recording fluorescent signals, the cells were diluted five-fold into a quartz cuvette with BSA-free 37 °C SPF-PCB to achieve a final BSA concentration of 0.1% (1.2 mL
10 of 37 °C BSA-free SPF-PCB + 0.3 mL cell suspension). Measurements of fluorescence were performed at 37 °C with constant stirring using a custom-built spectrofluorimeter (Biomedical Instrumentation Group, University of Pennsylvania). Excitation and emission wavelengths were 340 and 510 nm, respectively. To calibrate fluorescence signals, digitonin (Sigma Chemical Co.,
15 St. Louis, MO; catalog # D-5628; 50 μ g/mL, final) was added to obtain maximal fluorescence (F_{\max}), and the apparent minimal fluorescence (F_{\min}) was determined by adding TRIS-Base/EGTA (10 mM, pH 8.3, final). Concentrations of intracellular Ca²⁺ were calculated using a dissociation constant (K_d) of 224 nM and applying the equation:

20

$$[Ca^{2+}]_i = (F - F_{\min} / F_{\max}) \times K_d;$$

where F is fluorescence measured at any particular time of interest and F falls between F_{\max} and F_{\min} .

25

Control responses to the addition of 5 mM Ca²⁺ (final extracellular calcium concentration, 6 mM) were determined in separate cuvettes. Control responses to changes in extracellular calcium were determined throughout the length of the experiment. Compounds were tested at a single concentration per cuvette of cells, and all compounds were prepared in DMSO. Appropriate
30 dilutions were made such that compounds were added in no greater volume than 10 μ l per a total volume of 1500 μ l (final DMSO not greater than 0.67%) to achieve any particular testing concentration.

Once a stable intracellular calcium baseline was achieved, the compound was added to the cuvette. The response or lack of response to the compound addition was allowed to stabilize for 1-3 minutes and then 5 mM calcium was added to determine the effect of the compound on the subsequent calcium response. Once the peak for the subsequent calcium response was obtained, digitonin and EGTA were added in a sequential manner to determine F_{\max} and F_{\min} respectively. Data were expressed as changes in intracellular calcium concentrations in nM. These changes in the calcium response post compound addition were compared to the control (no compound) calcium response. Responses to calcium in the presence of test compounds were normalized as a percent change from that of controls. Data were entered into a Levenberg-Marquardt analysis for non-linear least squares and an IC_{50} and 95% confidence intervals thereof were determined for each compound.

The invention thus has been disclosed broadly and illustrated in reference to representative embodiments described above. Those skilled in the art will recognize that various modifications can be made to the present invention without departing from the spirit and scope thereof.

What is claimed is:

1. A compound represented by the formula I,

wherein R is selected from the group consisting of C₄-C₆ alkyl, phenylethyl, 4-methylcyclohexyl, *trans*-4-methylcyclohexyl, 3,4-dimethylcyclohexyl, 2-phenylethyl, quinolyl, 2-phenylpropyl, adamantyl, cyclopentyl, and cyclohexyl, wherein some or all of the hydrogen atoms on up to two carbon atoms optionally may be replaced with substituents independently selected from the group consisting of F, Cl, OH, OMe, and =O,

wherein Ar comprises a ring system selected from the group consisting of a 2-pyridyl, 3-pyridyl, 2-quinolyl, 3-quinolyl, 6-quinolyl, 2-quinoxaliny, 2-benzothiophenyl, 2-benzofuranyl, 2-benzothiazole, 4-indolyl, 5-indolyl, 6-indolyl, and 7-indolyl moiety, wherein Ar optionally may independently be substituted with up to two C₁-C₃ alkyl groups, CF₃, -O-(CH₂)-O-, -O-(CH₂)₂-O-, OMe, or up to two halogen atoms, where halogen is selected from F, Cl, Br, and I, and

wherein linker comprises an amide, ester, or thioester group, wherein up to 4 CH₂ groups may independently be substituted with groups selected from the group consisting of C₁-C₃ alkyl, CHOH, CO, O, S, SO, SO₂, N, NH, and NO, two heteroatoms in the linker may not be adjacent except when those atoms are both N or when the linker comprises a sulfonamide moiety, and wherein any two adjacent CH₂ groups may be replaced by a substituted or unsubstituted alkene or alkyne group,

or a pharmaceutically acceptable salt thereof.

2. A compound having the structure,

wherein X¹ and X² independently are CH or N,

X^3 is N or C-E

A, B, D, and E independently are selected from the group consisting of H, OMe, F, and CF_3 , or B and D together are $-O-(CH_2)-O-$ or $O-(CH_2)_2-O-$,

R is selected from the group consisting of:

C_4-C_6 alkyl,

and

wherein K is H or Me,

G^1 is H, Me, or phenyl,

G^2 , K, L, and M independently are H or Me,

n is 0, 1 or 2,

and X^4 and X^5 independently are N or CH, or a pharmaceutically acceptable salt thereof.

3. A compound according to claim 2, wherein X^1 is N and X^2 is N.
4. A compound according to claim 2, wherein X^1 is CH and X^2 is N.

5. A compound selected from the group consisting of *N*-[2-(2-fluorophenyl)propyl]quinoxaline-2-carboxamide, *N*-(pentyl)quinoxaline-2-carboxamide, *N*-(cyclopentyl)quinoxaline-2-carboxamide, *N*-(1-adamantyl)indole-6-carboxamide, *N*-[2-(2-fluorophenyl)propyl]quinoline-3-carboxamide, *N*-[2-(2-fluorophenyl)propyl]quinoline-6-carboxamide, *N*-(*trans*-4-phenylcyclohexyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)indole-5-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-2-phenoxy nicotinamide, *N*-(6-quinolinyl)-4-methylcyclohexane-1-carboxamide, *N*-(1-adamantyl)-5-(2-cyanoethyl)nicotinamide, *N*-(1-methyl-4-phenylcyclohexyl)quinoxaline-2-carboxamide, (*S*)-*N*-(1-phenylethyl)quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)indole-4-carboxamide, *N*-(*trans*-4-methylcyclohexyl)indole-6-carboxamide, *N*-(*trans*-4-methylcyclohexyl)furan-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)thiophene-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)benzothiophene-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)benzofuran-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-3-dimethylaminobenzamide, *N*-(*trans*-4-methylcyclohexyl)-2-methyl-1,8-naphthyridine-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-2-(trifluoromethyl)-1,6-naphthyridine-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-2-methyl-1,6-naphthyridine-3-carboxamide, *N*-(3-quinolinyl)quinoxaline-2-carboxamide hydrochloride, *N*-(*trans*-4-methylcyclohexyl)-6-bromopicolinamide, *N*-(adamantyl)-5-(1-piperidine)nicotinamide, *N*-(*trans*-4-methylcyclohexyl)-2-carboxamide benzothiazole, *N*-[2-(2,6-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-ethylenedioxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,8-difluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxy-7-fluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-7-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-

methylcyclohexyl)-8-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-fluoroquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5-fluoroquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-methoxyquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6,7-methylenedioxyquinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-(1-pyrazole)nicotinamide, *N*-[2-(2,3-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(2,4-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(2,5-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-[2-(3,4-difluorophenyl)ethyl]quinoxaline-2-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-8-methoxyquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-5,7-difluoroquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-trifluoromethylquinoline-3-carboxamide, *N*-(*trans*-4-methylcyclohexyl)-6-(phenylether)picolinamide, and *N*-[2-(3,5-difluorophenyl)ethyl]quinoxaline-2-carboxamide, and pharmaceutically acceptable salts thereof.

6. A pharmaceutical composition comprising a compound according to any of the preceding claims and a pharmaceutically acceptable diluent or excipient.

7. A method of inhibiting activation of an mGluR Group I receptor, comprising treating a cell containing said receptor with an effective amount of a compound according to any of claims 1-5.

8. A method of inhibiting neuronal damage caused by excitatory activation of an mGluR Group I receptor, comprising treating neurons with an effective amount of a compound according to any of claims 1-5.

9. A method of treating a disease associated with glutamate-induced neuronal damage, comprising administering to a patient suffering from said disease an effective amount of a composition according to claim 6.

10. A method according to claim 7, wherein said method is useful for the treatment of neurological disorders and diseases, psychiatric disorders and diseases, and ophthalmological disorders and diseases.

11. A method according to claim 10, wherein said neurological disorder and disease is selected from the group consisting of senile dementia, Parkinson's disease, Alzheimer's disease, Huntington's Chorea, pain, neuropathic pain, epilepsy, head trauma, anoxic injuries, ischemic injuries, and tinnitus.

12. A method according to claim 10, wherein said psychiatric disorder and disease is selected from the group consisting of schizophrenia, depression, and anxiety,

13. A method according to claim 10, wherein said ophthalmological disorders is selected from the group consisting of diabetic retinopathies and glaucoma.
